DO YOU LACK STEAM? WE CAN HELP YOU

A Great Steam Generator

Develops every ounce of power a boiler is capable of making, regardless of the weather or of the character or condition of the fuel.

The Gordon Hollow Blast Grate will enable you to carry from 80 to 100 lbs. of steam where you are now carrying from 60 to 70 lbs.

It will also enable you to burn wet, green or frozen sawdust or other refuse, and to obtain as good result with them as you now obtain with dry wood.

It is practically a refuse burner under your boilers, offering the best and most economical means in existence for disposing of refuse, doing away with all hauling, and utilizing the heat derived from the refuse to run the mill, thus converting it from a source of expense into a source of profit.

If 30 days' trial does not demonstrate the grate to be a profitable investment you may return it at our expense. Can you imagine a more liberal guaranty? It not only relieves you of all risk, but forcibly illustrates our unlimited faith in the grate.

In writing for prices, do not fail to give number of boilers, width of furnaces or ovens, and length of grates desired.

SAMPLE TESTIMONIAL.

"We were using ordinary grates. Found it impossible to keep steam. Put in your grate. Could then burn sawdust and green slabs, using one less furnace, and keep steam "popping off." Would not run a mill without them."
POND-DECKER LBR. CO., Deckerville, Ark.

Remember that we are also the sole manufacturers of the Celebrated "Tower" line of edgers and trimmers.

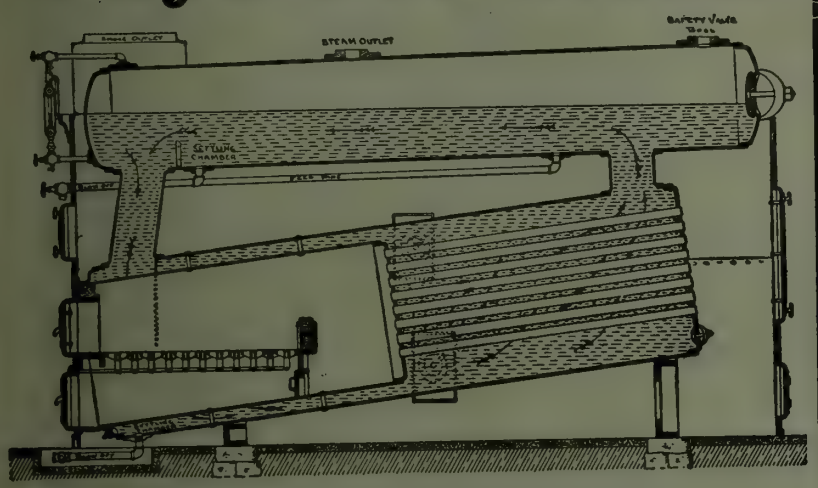
Pays For Itself



A Mumford Standard internally fired boiler requires from 10 to 25 per cent. less fuel than a return tubular boiler.

A saving of only 10 per cent. will cover the cost of the boiler in five or six years.

A Mumford boiler will therefore pay for itself several times during its lifetime.

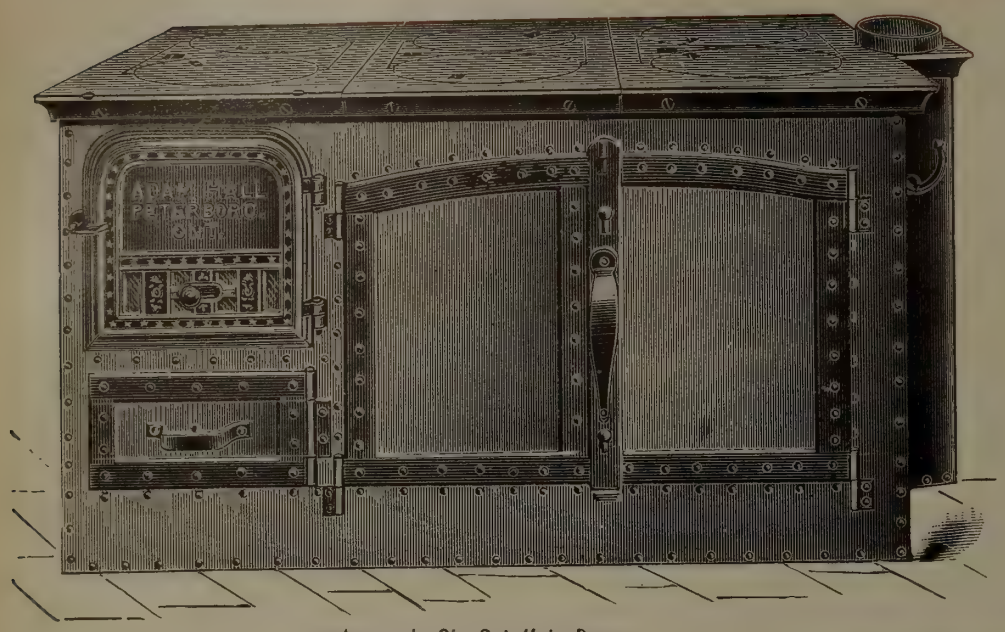
STEEL RANGES

For Lumbermen's and Railway Camps, Boarding Houses and Hotels

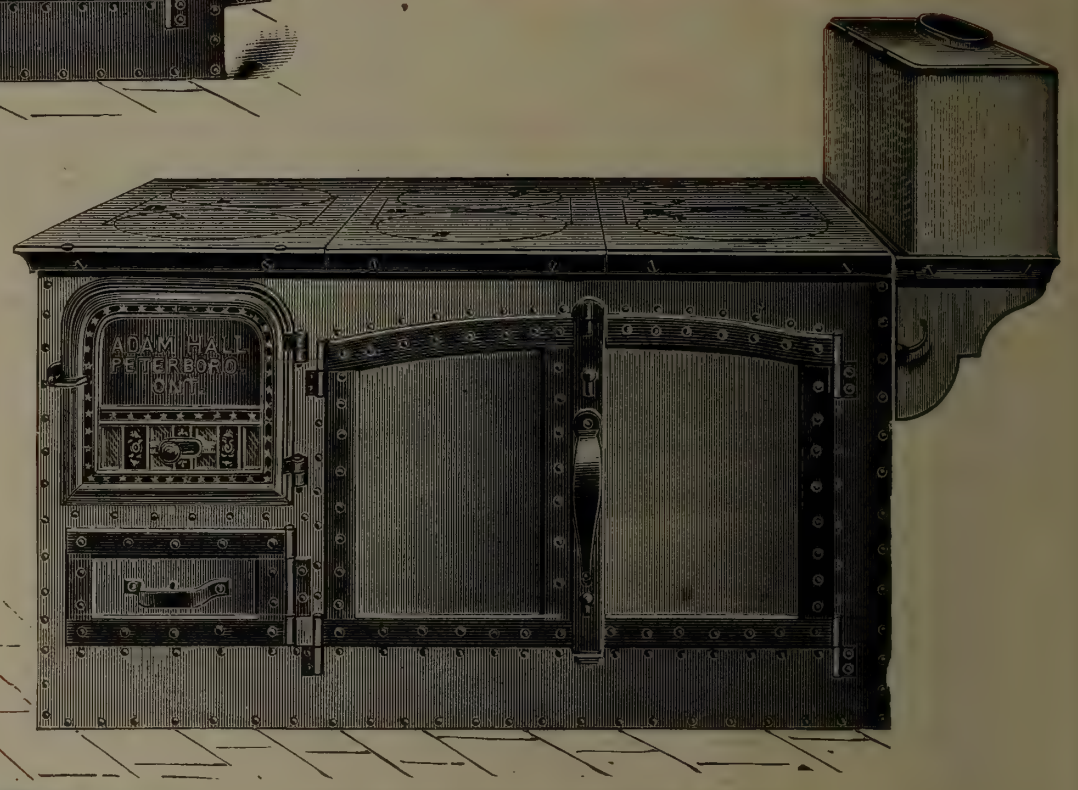


Lumbermen's Six Pot Hole Range.

We have been manufacturing Steel Ranges and Heaters for Lumber Camps for the past Twenty-four Years, and have supplied the wants of nearly all the Lumbermen in Quebec, Ontario and Manitoba—they are unexcelled for Baking and Cooking, and are strong and durable.

This No. 1025 Six Pot Hole Range is largely used in Camps of Fifty (50) Men and for use when driving the Rivers. Weighs 400 pounds.

This No. 1025 Range with 25 Gallon Copper Reservoir is the one we sell the most of, owing to the convenience of having a supply of hot water at all times. Will cook for 50 to 60 men. Weighs 450 pounds.



Lumbermen's Six Pot Hole Range with Reservoir.

Coal or Wood Range for Hotels and Boarding Houses.

This No. 1026 Leader Range with Front Hearth and Copper Reservoir is made for either Coal or Wood and is largely used in Boarding Houses and Hotels. The Wood Range weighs 500 pounds; the Coal Range weighs 600 pounds.

We make a number of other sizes of Ranges, also a **Lumberman' Box Stove** of Heavy Steel Body and Cast Metal Ends, in 36 inch, 42 inch and 48 inch—they are Excellent Heaters, Strong and Durable.

This Saw Stands Without a Rival

AND IS THE

FASTEST CUTTING SAW IN THE WORLD!

Its Superiority consists in its Excellent Temper. It is made of "Razor Steel," which is the finest ever used in the manufacture of Saws. We have the sole control of this steel. It is tempered by our secret process, which process gives a keener cutting edge and a toughness to the steel which no other process can approach.

Maple Leaf Saw Set

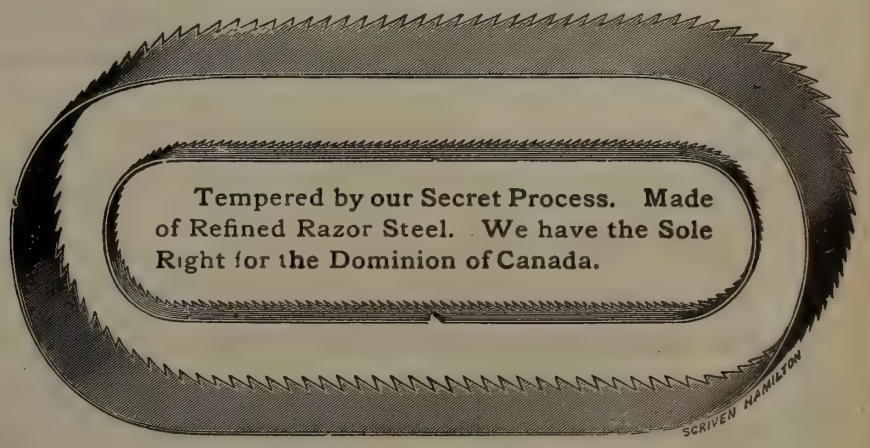
MANUFACTURED BY

SHURLY & DIETRICH, Galt, Ont.

Directions.—Place the set on the point of tooth, as shown in the accompanying cut, and strike a very light blow with a tack hammer. If you require more set, file the tooth with more bevel.

If you follow directions you cannot make a mistake. Be sure and not strike too hard a blow, and it will set the hardest saw. **On receipt of 40 cents we will send one by mail.**

We are the only manufacturers in the world who export Saws in large quantities to the United States.



We Manufacture

HIGH GRADE BAND SAWS

Of All Widths and Lengths.

These Saws are made of Refined Swedish Steel imported direct, and tempered by our Secret Process; for Fine Finish and Temper are not excelled.

Horse Sense

Could be taken to mean Common Sense in the treatment of your horses. All Lumbermen depend largely on the efficiency of their horses. This can easily be maintained if

Johnson's Veterinary Remedies

are used.

The following valuable preparations have been largely in use amongst the Lumbermen of the Dominion for years. They are put up in bulk and are therefore more economical than similar lines, as the cost of packages, bottling, etc., etc., is saved :

Johnson's Horse Liniment No. 1

A penetrating Alcoholic Liniment for Sprains, Strains, Bruises, Swellings, Lameness, Curbs, Splints, etc., etc.,$4.50 per Imp. gallon.

Johnson's Horse Liniment No. 2

An excellent Oil Liniment for the same purpose, $3 00 per gallon.

Johnson's Horse Colic Remedy

An absolutely safe and quick remedy for Colic of all kinds, $5.00 per Imp. gallon.

Johnson's Veterinary Healing Ointment and Gall Cure.

Positively the best all round Healing preparation on the market for Cuts, Corks, Sore Shoulders, Wounds, Galls, Scratches, etc., etc., $2.25 per 2 pound tin. Put up in 4 ounce tins if preferred. Special prices for quantities—Ask your lumbermen friends about this King of all Gall Cures.

Ten per cent. discount off orders amounting to $50.00 or upwards. A full stock of all Drugs and Patent Medicines kept always on hand at lowest wholesale rates. Correspondence solicited. Orders by mail receive special attention. Let me figure on your requirements.

DUNDAS, ONT.

Canada Chisel Tooth Saw Patent For Sale

Date November 24, 1903

Something new. No hammering required. Will run two gauges thinner than any other saw and make better and smoother lumber. The holder costs less to manufacture than the tooth, which is a very simple drop forged tooth. No milling or machine work on the plate, consequently a higher tempered plate and a plate that will require no hammering, as there is absolutety no wear in service or in changing the teeth; no rivets nor wedges. The only chisel tooth that will stand heavy feed, and in which the teeth will not spring and set from the log in use. To parties who mean business and want to control the inserted tooth saw trade in Canada, I will sell cheap. I will retain my U.S. Patent, and need more funds to push it. Other patents now pending, and will be assigned. Cut sample of tooth and holder, and sworn statement of results from a test of this saw will be furnished to those interested who have a good commercial rating, and a saw will be shipped for trial. TREND OF THE CAMP SUPPLY TRADE

Price Fluctuations During the Past Year Comparatively Narrow.—Only a Few Lines Show Important Changes.—Labor Still Scarce and Wages High.

In this, our Second Annual Camp Supply Number, it is appropriate to take a retrospective glance over the field and enumerate the changes which have taken place in the prices of supplies for the logging camps as compared with one year ago. Not that we can hope to tell the purchasing agents of our lumber companies much that is not already within their knowledge, but rather that in crystalized form the information may be useful for comparative purposes and for reference at some future time.

The business of supplying the camps is of increasing importance, for while our production of lumber may have already reached the maximum quantity, more men are required to-day to bank a given number of logs than were necessary ten or even five years ago. The average woodsman of to-day is a man of independence. He knows that if his services are rejected in one camp he will be extended a hearty welcome at another. In other words, the labor supply is scarcely equal to the demand, and the shantyman does not feel that compulsion which he once did to exert himself in his employer's behalf. This latter remark will apply to other walks of life as well as "in the woods". Nevertheless, the result is that the lumberman conducting operations on a similar scale to some years ago is called upon to provide food for a greater number of men.

Taken as a whole, camp supplies have remained almost stationary during the past year. Some lines have advanced, others declined. The most important advance is in the price of cotton goods, owing to the sharp but somewhat artificial rise in the price of the raw material. Pork prices represent the greatest decline, current values being much lower than one year ago.

THE DINING ROOM OF A LOGGING CAMP.

LABOR.

As in all other lines of industrial effort, the labor problem plays an important part in the lumber world. True, strikes have never in an organized state caused much trouble except at the mills, but on the other hand the question of supply and demand has always cut a big figure on the limits. This problem has in fact reached an acute stage in the past few years, and naturally occupies much attention and creates much discussion.

Since the days of Bytown, Ottawa has held the position of Hub in the Eastern Canadian lumber world. The far reaching river with which the Capital shares its name, has been the means whereby the industry has been developed and maintained. The Chaudiere district alone with its mills has attracted and held an industrial army in Ottawa. Hence it is but natural that the city should have become the great hiring center for the workers on the limits and the log drives. Even the firms operating in the Georgian Bay district and farther west in Ontario look to the Capital for their men. As a matter of fact though, Winnipeg entered the field last year and supplied many hundreds of men for the Lake of the Woods district. The popular move to the Canadian West filled the streets of the Manitoba Capital and neighboring towns with strong young immigrants from the British Isles particularly, and Europe generally. After the summer's work in the harvest fields, these men were out of employment and readily accepted work on the limits. As the rate of wages was lower than in Ottawa, the American firms gave the western men the preference. Just here it may be remarked that this new phase of the labor problem may have an important bearing in Ottawa, but it is difficult at present to make a prediction with any degree of assurance.

Getting back to Ottawa, however, it may be stated that until recent years the supply of men was equal if not greater than the demand and wages remained normal. Wages have been known to drop as low as $10 a month and board, and $18 a month and board was considered a good thing. The French Canadian had the field to himself, and the field had the French Canadian to itself. The mill, camp and drive were his principal avenues of employment. However, the establishment of pulp and paper mills, the building of railways, the movement to Western Canada and the northern parts of Quebec and Ontario, and the increased industrial activity in the cities, have all done their share in recent years in luring the hardy lumber jack from the limits. With this marked decrease in the labor supply came a corresponding increase in the demand and a decidedly interesting situation was the result. The influx of American capital and the increase in Canadian capital in the Georgian Bay, Nipissing, Kippewa, Temiskaming and other districts made a new and vigorous call for men, and Ottawa had to respond. The consequence was a rapid advance in wages, in fact they have doubled within the past few years. The ruling wages for the season just closed were: Axe hands, $30 to $32 a month and board; teamsters, $35 a month and board; road men, $30 a month and board; river drivers, $40 to $45 a month and board.

The question naturally arises, will these

wages hold good for the future, or will they suffer a decline or advance? A prominent Ottawa district lumberman gave it as his opinion that the wages would drop. He figured that there would be an easier feeling in the labor market during the coming summer, and that lack of other employment would make more men available for the limits and consequently wages would drop.

On the other hand, the managers of the employment agencies state that the wages will remain firm at the figures quoted above. There seems a good prospect of the resumption of operations on the part of the Soo companies and that will make an increased demand for men. Then again the building of the Grand Trunk Pacific Railway will make a hole in the supply of labor, but it is hardly likely this will affect the lumber interests before next year.

The French Canadians' undisputed claim to the work on the limits and drives is being challenged. Winnipeg was not the only city that sent hardy immigrants into the camps. Several hundred, nearly all Britishers, were forwarded from Ottawa. With their willingness to work and their natural intelligence they made good, where other immigrants from across sea would have failed. The Canadian firms are averse to engaging any but the French Canadians, claiming that the others, not having the necessary experience, are a hindrance rather than a help. However, the American firms think different. As was the case with the men hired in Winnipeg, they were not averse to giving the new comers a trial. Of course, they started them in at reduced wages, but this was only an incentive to the immigrants to quickly master the fine points of the game and get on the full pay list. As a matter of fact they are even eager to try their hand at log driving, but few have been engaged for this risky work.

In discussing the future of the labor question as far as it affects the lumber industry, the buoyancy of the lumber market itself must not be overlooked. As long as high prices rule, the men hiring for work on the limits and drives and in the mills will demand correspondingly good wages. As long as the supply of good help remains short, they will get what they ask. This phase of the case takes on a humorous turn when it is borne in mind that the high wages are responsible in a large measure for the advance in lumber.

The hardy contented lumber jack of former years is slowly but surely passing from the land. High wages in other lines of industrial activity and the prospect of an all year residence in town or city has lured many of the able bodied fraternity from the limits. Their places have been taken by undersized youths and inexperienced men from different walks of life. As a consequence there was no end of trouble last winter from "jumpers." The proximity of the railways and the very question of wages itself were responsible for the flittings to and fro of the hands. In former years the men at the low wages were content, even eager to work, not only the whole season but season after season, with the one company. The following is a copy of the agreement demanded by one of the leading employment agencies which was found to give satisfaction and prevent "jumping" :

"We the undersigned do hereby agree to work for and faithfully serve
during the lumbering season of 190 and following spring for the wages and in the capacity shown below, transportation to the camps to be advanced by the Company and repaid by the undersigned, but will be refunded to those who have worked until the end of the hauling season. The Company agrees to remit monthly on demand one-half of the wages earned by the men to their families so soon as men have worked sufficient time to protect transportation. Insobriety, insubordination or incapacity to be sufficient causes for dismissal at any time."

The manager of this company stated that the law will not uphold a company that makes any deduction other than that for railway transportation when a man quits his job before his time is up.

SLEIGH HAUL, CLEVELAND-SARNIA SAW MILLS COMPANY, ON VERMILLION RIVER.

SKIDDING LONG TIMBER WITH STEAM SKIDDER, CLEVELAND-SARNIA SAW MILLS COMPANY.

GROCERIES AND PROVISIONS.

The lumberman who contemplates operating in the woods next winter will probably be able to purchase his meat supply at very favorable prices; in fact, it is a question if he should not take advantage of the low prices which now prevail. Compared with one year ago barrelled pork, which is one of the principal commodities purchased for the lumber camp, can be obtained at a decline of six dollars per barrel. Current prices of live hogs and packing house products as compared with the corresponding time in 1903 are as follows :

	1903.		1904.	
Live Hogs,	$ 6.75	to $ 7.00	$ 5.12½	to $ 5.25
Mess Pork,	20.00	to 21.00	14.00	to 15.00
Pure Lard,	10	to 10¼	7¾	to 8
S. P. Hams,	11	to 11½	10½	to 11
Smoked Hams,	12½	to 13	12	to 12½
Long Clears,	9½	to 10	7½	to 8

It would seem reasonable to expect a stronger tone to the pork market throughout the summer period, as the consumptive demand will no doubt improve. It must be admitted that prevailing prices are on a very reasonable basis.

Grocery supplies have been somewhat uneven in price. One of the leading staples, sugar, is about 20 cents per 100 pounds higher than last year. On account of the prospects for the sugar trade in Europe this advance is likely to be maintained. Coffee is about ten per cent. higher than one year ago owing to a shortage in the crop and manipulative tactics on the part of speculators, but tea values show no material change. The price of evaporated apples is about ½ cent per pound higher, the supply being in a few hands and indications pointing to no decline in price before autumn,

even if then. In cloves there has been an advance of almost 100 per cent. Canned goods are higher in the majority of cases, and present prices of sauer kraut and pickles are $1 per barrel above those of last year. Oatmeal shows an advance of about $1.00 per barrel, but there is no material change in split peas and pot barley.

Of the few articles showing a decline in price are rice and white beans, which are about 10 per cent. lower. Beans have recently been advanced in the United States and the market here is very steady and may advance in the near future. Prunes are slightly lower than last year; in tobacco there has been no change.

Molasses are probably more uncertain in price than any other commodity supplied by the wholesale grocer. In the West prices are about the same or slightly higher than one year ago, but the market in the Maritime Provinces has been unsettled by large importations from the West Indies, where conditions have been favorable to a large production. Barbadoes molasses is now quoted as low as 9 cents per gallon. Barbadoes has a very large crop, whereas Porto Rico will fall short in its output of Muscovado molasses, which is the grade principally consumed in the Maritime Provinces. The Barbadoes market opened on January 25th at 12 cents, declined February 4th to 11 cents, February 13th to 10 cents, and held strong at 10 cents until April 6th, when it declined to 9 cents, from which there has been no further break. In 1903 the market opened at 10 cents and was in a short time forced up to 18 cents. In April, 1902, Babadoes molasses was purchased for the St. John market as low as 7½ cents. From what can be learned the present decline, while influenced by overproduction, is to some extent due to competition between rival shippers.

Owing to the recent change in the assessment of duty on molasses, there will be less of the low grade New Orleans product imported into Canada than there has been in past years, and there will probably be a greater consumption of molasses produced in the British West Indies, which is of a superior quality. A large quantity of New Orleans molasses has been imported into Western Canada in late years.

From present indications, with few exceptions, there is likely to be very little change in the prices of groceries during the next six months.

CLOTHING.

Clothing supplies for the lumber camp are likely to be more expensive than last year, and especially articles made from cotton, such as overalls, top shirts, etc. Cotton goods have advanced about 25 per cent. this year and are not likely to be any lower until after the next crop at the earliest. If the cotton crop of the Southern States should be even a partial failure this year, still higher prices for goods made of this material may be experienced. A large consumer of cotton rope advises us that he is paying $5.50 per hundred more for this material than was paid last Fall. Woolen goods are about the same as last year on many lines, but the heavy articles composed of pure wool have advanced from 5 to 10 per cent. on account of the increased cost of raw material. There is very little difference in the price of general lines of ready-made clothing. Larrigans, moccasins and snow shoes are the same as last year.

The price of rubber boots has recently been advanced from 50 cents to $1 per pair, this course being rendered necessary by the increased cost of raw rubber which now enters into the manufacture of so many articles. On December 30th last raw rubber was quoted at 96 cents; a year and a half previously it was only 70 cents; now it is $1.17. The American manufacturers of rubber boots have since February 1st last advanced prices 20 per cent. In Canada the advance thus far has been only 5 per cent., but it is understood that a further marking up of values is impending.

LOGGING APPLIANCES.

United States manufacturers of axes have to some extent made Canada a slaughter ground from their goods, and competition for this source has been felt quite keenly by the Canadian makers, some of whom advocate a return to a specific duty instead of the ad valorem duty which now exists and which they claim gives too great opportunity for flooding our market with the cheap grades of tools. Canadian manufacturers, however, have maintained prices remarkably well, relying on the quality of their goods to hold the trade. Prices of axes, peavies, cant hooks, pike poles, skidding tongs, etc., have therefore undergone no appreciable change in price as compared with last year. The tendency in logging tools, if anything, is towards an advance, especially in those lines where the handle constitutes the principal cost of the tool, as increased difficulty is being experienced in securing suitable timber for making handles and higher prices have to be paid for it. Steel in the finer grades also shows a tendency to advance, which must be considered in fixing the price of the manufactured article. These remarks will also apply to saws, which have remained stationary in price but which are more likely to advance than to decline.

Logging sleighs are more expensive, the chief agent in producing this result being the higher cost of timber. Prices of stoves, ranges and tinware for lumber camps are almost the same as last year, and unless there is a decided change in the United States, Canadian manufacturers are not likely to alter their quotations in the near future, as present selling prices bear a fair relation to the cost of the raw material and leave a fair margin of profit for the manufacturer.

HORSES AND THEIR SUPPLIES.

The best method of obtaining a supply of horses for woods operations is a question to which lumbermen have been obliged to give more consideration in late years. Previously the custom with many of the large firms was to purchase only a limited supply of horses and rely upon hiring a sufficient number from teamsters and settlers in the vicinity of operations to handle the cut of logs. This plan worked satisfactorily, but the greater demand for labor which has been experienced in recent years encouraged the settler to place a higher value on his hire, and ruling wages have been from $3.50 to $5 for one man and a team. An unexpected difficulty arose, however. Naturally the timber most accessible was first taken out and logging operations became more difficult each year. Many of these settlers, untamiliar with the logging business, would not drive their teams down hills and in other seemingly treacherous places, and the lumbermen were obliged to have their own men take the reins in such cases, handing over the team to the settler after the danger point had been passed. They are willing to risk their horses but not their own lives. The unsatisfactory character of the work performed by the settler, therefore, has induced a number of the lumber firms to purchase in the fall of the year all the horses required for their woods operations. These are sold again the following spring; if in the meantime the demand for and price of horses has improved, the lumberman may be able to realize as much as he paid for them; if not, he stands the loss, feeling that the work performed by the animals during the winter has amply repaid him.

The horse market is not materially different from one year ago. General purpose horses, 1200 to 1350 pounds, are worth from $145 to $190, whereas in the spring of 1903 the selling price quoted was $140 to $200. The depletion of the supply in Eastern Ontario and Quebec, however, makes it highly improbable that there will be any decline in the price of horse flesh for next season's work.

Hay and oats are slightly lower than last spring, but the future course of prices will depend altogether on the crop harvested. The season so far has been backward and very unfavorable for seeding and the growing of grain and crops of all kinds.

MEETINGS OF LOG DRIVING COMPANIES.

The annual meeting of the St. John River Log Driving Company was held at Fredericton, N. B., on April 8th, Mr. A. H. F. Randolph in the chair. Those present included Messrs. W. H. Murray, John E. Moore, Henry Hilyard, J. F. Gregory, George S. Cushing, N. H. Murchie, E. L. Jewett, Charles Miller, F. D. Miles, St. John; Donald Fraser, sr., John Kilburn, Archie Fraser, Donald Fraser, jr., John A. Morrison, Robert Aiken, James M. Scott, Fredericton; G. R. Burtt, J. E. McCallum, Hartland; Senator Baird, Perth, and A. J. Beveridge, Andover. A statement was given out that the logs cut on the St. John river last winter was estimated at 140,000,000 feet. The logs will be driven by Mr. Morrison, whose contract does not expire until next year. The following board of directors was elected: John E. Moore, president; J. F. Gregory, secretary treasurer; John Kilburn, Charles Miller, A. H. F. Randolph, and Henry Hilyard.

The Tobique River Log Driving Company held their annual meeting at Fredericton on April 7th. Henry Hilyard was re-elected president, and J. C. Hartley, of Woodstock, secretary treasurer. The other directors are Donald Fraser, jr., Senator George T. Baird, R.A. Estey and N. H. Murchie. The contract for driving from the forks to the mouth was let by public auction to Archibald Fraser at 23 cents on a 3-year contract. It is estimated that 38,000,000 feet will be driven down the Tobique river this season.

J. T. Schell, M.P. for Glengarry, has purchased the interests of his partner, D. M. Macpherson, in the well-known lumber firm of Macpherson & Schell, Alexandria, Ont. It is Mr. Schell's intention to further enlarge his extensive wood-working plant.

NEW SAW MILL AT WINNIPEG.

The Rat Portage Lumber Company, Limited, of which Mr. D. C. Cameron, M.P.P., is president and manager, have recently completed a modern saw mill at Winnipeg, Man. The photograph of same reproduced herewith was taken last fall before the mill was fully completed. The location is on the banks of the Red river adjacent to the city of Winnipeg, and convenient for the distribution of the product of the mill throughout the said city and suburbs.

NEW MILL OF THE RAT PORTAGE LUMBER COMPANY ON THE RED RIVER AT WINNIPEG.

The plant comprises saw mill, planing mill, box factory, sash and door factory and dry kilns. The design of the plant is such that it will take the timber or raw material and manufacture therefrom all the material made from wood that the builder may need in his general business.

SAW MILL STEAM POWER.—The saw mill will contain two double cutting band saws with the necessary edgers, trimmers and saws of various descriptions for the proper manufacturing of lumber, timber, lath, etc. The mill is entirely modern, being equipped with all the necessary steam operating machines for rolling, canting and transferring logs and lumber during the course of manufacture, nothing being omitted that will in any way facilitate the operations, reduce labor, or even make heavy labor lighter.

The band saws were built by the Waterous Engine Works Company, of Brantford, Ont. They are of the double cutting type, the saws having teeth on both edges, and really might be called two-faced saws, but if properly manipulated they are true as steel and will turn out lumber of excellent manufacture. The edger is a very heavy machine supplied by the Waterous Engine Works Company. It is adpated to edge boards, plank, and manufacture from cants small timber, which will in a measure add to the capacity of the mill. The balance of the machines and equipment in this mill were also built and supplied by the Waterous Company. A full line of the most modern filing machinery for the fitting up of the band saws has been installed.

PLANING MILL.—The planing mill is calculated and designed to manufacture flooring, siding, ceiling, shiplap, mouldings, and to dress lumber in all the varied forms called for. McGregor, Gourley & Company and Cowan & Company, Limited, of Galt, Ont., manufactured and supplied all the machinery in this mill, and it is of their best make.

BOX FACTORY.—The box factory is supplied with up-to-date machinery for the manufacture of boxes of all sizes and kinds. The machinery for this part of the plant was also supplied by McGregor, Gourley & Company, of Galt.

SASH AND DOOR FACTORY.—The sash and door factory, while having in view the manufacture of standard stock, is particularly designed for the manufacture of special orders which are met with so often in city trade, and it will be a valuable auxiliary to the already established factories which the company now have for manufacturing standard stock.

DRY KILNS.—The dry kilns for drying the lumber for the factories are of the design known as the moist air process. The machinery and fixings for this kiln, as well as the dust machinery for the factories, are being supplied by Sheldon & Sheldon, of Galt, Ont., and are of their latest design.

The principal motive power for this plant consists in a pair of cross compound Corliss engines, energized by a battery of boilers, having all the necessary pumps, condensers, etc., neatly housed in a brick building having metal roof and thoroughly fire-proof. The engines were built by the Inglis & Hunter Company, of Toronto, and the boilers by the Bertram Engine Works Company, of Toronto.

The whole plant will be lighted by electricity. The dynamo is of the multipolar type and was supplied by the E. S. Harrison Company, of Winnipeg; it is driven by a McEwen high speed engine built by the Waterous Engine Works Company, of Brantford. Other auxiliary engines are placed in convenient places to perform part of the work referred to.

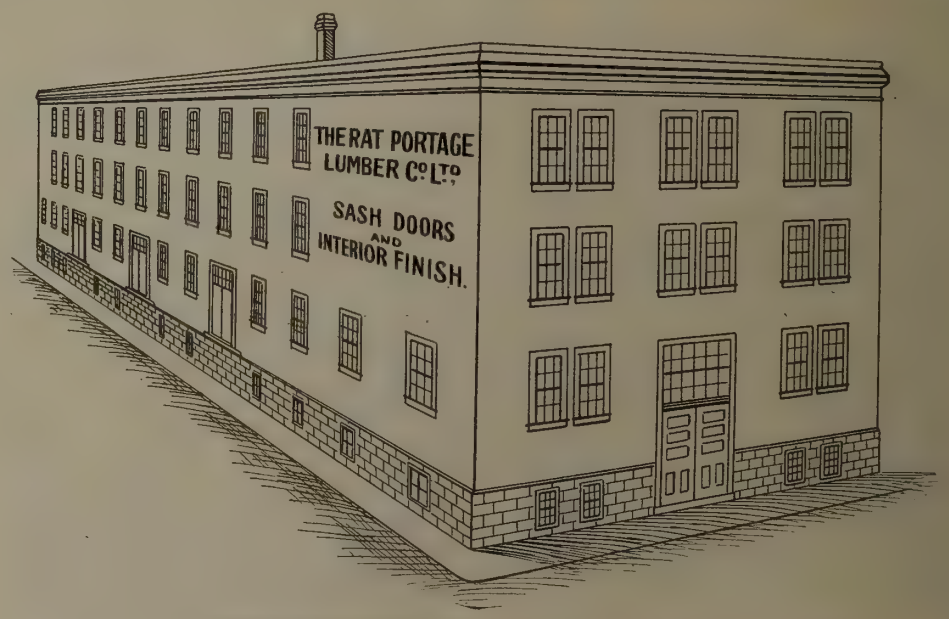
The buildings were constructed with a view to reducing the insurance to a minimum. The mills and factories are what is known by underwriters as Standard Mill construction and will be fitted up with the dry pipe sprinkling system. The roofs are metal clad, the walls painted with fire-proof paint and the buildings whitewashed inside.

The mills and factories will be operated continuously and will be fitted up with steam heating apparatus for the winter.

The logs will be brought to the mill by rail and dumped into a pond artificially made for this purpose, and floated to the foot of the jack ladder. The water to supply this artificial pond will be pumped up from the Red River, a large pump and pipe system having been installed for this purpose.

The water as it is pumped up from the Red River will pass through the condenser, which will condense the steam from the Corliss engines and heat the water in the pond, so that it will not freeze up in the winter, thus doing double service. The prevention of fire will have attention and the necessary hose and hydrants will be placed conveniently.

The buildings were constructed and the machinery installed by the company's own men, excepting some minor contracts, and the whole work done by the direction of the company's engineer in charge.



SASH AND DOOR WAREHOUSE OF THE RAT PORTAGE LUMBER COMPANY, WINNIPEG.

The sash and door warehouse in Winnipeg, of which a drawing is shown, is a four storey building, including basement, 220 feet long and 60 feet wide. The floors are supported by heavy timbers capable of carrying very great weight. The building is frame, sheeted with steel.

SOCIAL AMELIORATION IN THE LUMBERING CAMPS.

By Alfred Fitzpatrick, B A., of Toronto,
Secretary of the Canadian Reading Camp Association.

References have already been made in your columns to a movement on foot in the Province of Ontario to establish reading and entertainment rooms, and a home study system of elementary education at the lumbering, mining and railway constructing camps of Canada.

Reading Room, Booth & Gordon's Camp, Azilda, Ont.

This work is mainly educational. It was begun in a tentative way. The isolation, and consequent moral degradation of many of these men, led to the belief that they ought to be surrounded with home-like influences and innocent pastimes ; that they ought to be kept in touch with the outside world, and led to sympathize with its problems by the beautiful in art and literature. It was felt in short that they should be given the privilege of an education.

With this object in view three separate shanties were built, one at each of three different camps in the district of Algoma. These were supplied with stoves, chairs, games, books, magazines and current newspapers in French and English. It was found that the men spent their evenings, rainy days and Sundays in these reading camps instead of going to the nearest town or village in search of questionable entertainment, and that the moral tone of the camps was decidedly raised. The employer now provides buildings and the provincial government supplies books. Some twenty-five reading camps were built and the work is being initiated in Manitoba and British Columbia and will be taken up later in the other provinces.

Our work is largely experimental and our object to develop public opinion in its favor, and urge the provincial governments, whose prerogative it is to educate our citizens, to take it up in all camps and make it a phase of public education. We do not attempt to cover even a tenth of the ground, but simply enough to demonstrate its practicability and popularize the movement.

CAMP SCHOOLS.

So far as employers are concerned there is little difficulty in securing buildings. It was found, however, that some one is necessary to supervise each reading camp, and as there are a large number of men who can neither read nor write, the Association decided that it was better to engage duly qualified teachers. Last year ten teachers were employed, two of whom were young medical doctors, a third a graduate of Oxford, a fourth a graduate of McMaster University, and two of the others were Undergraduates of Queen's and Toronto Universities respectively. The doctors practised medicine in the camps, and one of the teachers acted as clerk, while the others engaged in manual labor. Each men earned over one-half of his salary. The Association paid the balance.

This is not only home education for the employees in these isolated camps, it is manual training for teachers, and that too of a practical and useful sort. The benefits to both teacher and taught by the introduction of educated men into camp life cannot be over-estimated. There is no reason why a boy's education should end with the school building. Systems of education should be as flexible as the needs demand. The boy who for one cause and another escapes the school walls without an elementary education should be followed to the woods and mines. No state should tolerate an illiterate citizenship. That home education even at the most isolated mining and survey camps is practicable has been fully demonstrated by the correspondence schools. Thousands of young men in these frontier camps spend their spare moments in private study even where tenting but for a night.

To argue that home education is impracticable in the lumbering camps is to tell us either that woodsmen have absolutely no leisure and are to all intents and purposes slaves, or that they have no mind and soul and are a different order of beings from those engaged in surveying and mining, which line of argument no sane employer will adopt.

Considering that there are no counter attractions in the camps, although his hours of labor are long, the average shantyman has as much spare time as the average mechanic in the older settlements, towns and cities.

What is of more immediate importance is to enlarge the range of interest in life for the laborer that he may employ in a wholesome and profitable manner such hours of leisure as he has, that when the opportunity comes he may know how to use more free time. As a matter of fact, employers often fear to give their men too much spare time, not from mercenary motives, but lest the time should be abused and employed in gambling, drinking and worse evils. Experience proves that to increase the hours of freedom without ensuring that these hours are to be well employed is to drag men downward, and that this is true of the rich as well as the poor.

As already stated, the main difficulty in the extension of this work is not a question of buildings. All mining men and not a few lumbermen have either already made provisions of this kind at their camps or would be willing to do so if approached on the subject. The problem is largely one of supervision. In a few cases buildings have been provided that have not been a success because the employers and the Department of Education did not, and the Association could not, engage men to look after them. The most successful club houses in the more permanent mining camps and saw mill towns have a man in each case who devotes his whole time to making the particular institution under his care a success. The next

One of J. & T. Charlton's Camps—Reading Room, 9 Miles from Mouth of Whitefish.

are those in charge of teachers who engage in manual labor during the day, sawing, chopping, etc., and whose evenings are unemployed. Doctors and clerks are as a rule too busy evenings to accomplish much in the reading camps, although in some cases they have done good work.

As your readers are interested most in the lumbering industry I shall not devote much attention to work of this kind in the mining camps except by way of comparison.

The first club house at a mining camp in Canada so far as known to the writer was built by the Canada Copper Company at Copper Cliff, Ont., and its employees. This is an up-to-date building fully equipped with bath, parlor, reading room, etc. The first club house at a saw mill town is that at Cutler, Ont., built last spring by the N. N. Wright Company, now Loveland & Stone. This has been mainly an experiment on the part of the company and has been entirely successful. It is a commodious building, and was provided by the company with billiard and pool tables, etc., books from the Department of Education, stoves, chairs and daily papers and magazines from the Reading Camp Association, and a small organ from the Presbyterian Church of Weston. As at Copper Cliff a capable man is kept in charge by the company.

The good example set by the Canada Copper Company is being followed at other mining camps. The Massey Station Mining Company will erect a building for this purpose this spring, and the example set by Loveland & Stone is likely to be followed at other sawmill towns.

The writer is deeply grateful to many employers for their kindly interest and co-operation. The three companies which have invested most in this endeavor to benefit their employees are The Parry Sound Lumber Company, The Rathbun Company, and Loveland & Stone. Amongst others are Hale & Bell, J. J. McFadden, J. R. Booth, Playfair & White, The Georgian Bay Lumber Company, the late Edmund Hall, The Ontario Lumber Company, John Bertram, The Rat Portage Lumber Company, McLennan Bros. (Wabigoon), Alfred McDonald, Capt. Robinson, (Winnipeg), Booth & Gordon, J. & T. Charlton, N. & A. Dyment, British Canadian Manufacturing Company, The Brennen Company, Algoma Commercial Company, and others.

Some who very seriously questioned the feasibility of the work, and who did not provide buildings, as Mr. E. C. Whitney and Hon. W. C. Edwards, generously contributed cash. Others, as Messrs. Playfair & White, N. N. Wright and Loveland & Stone, supplied both cash and buildings.

Too much cannot be said in praise of these and other employers in their quiet unobtrusive effort to make "the wilderness and the solitary place glad and the desert to rejoice and blossom as the rose."

The Meyer-Thomas Company, Granby, Que., are building an extension to their box factory, 24x40 feet and two stories. They have recently opened a branch in Montreal.

QUEBEC TRADE PROSPECTS.

(By a Special Correspondent.)

There are indications that the season upon which we are entering will be a very plentiful one in the supply of lumber generally. The great scarcity in the water supply last year prevented the bringing down of the whole of the previous season's cut of logs and in addition this season's production has been large, which, combined with the stocks on hand, will place a very plentiful supply on the market. The home trade in the Province of Quebec is continuing to be well sustained and dealers are looking forward with every confidence to a good season's business. Prices are also ruling firm on the home trade, although a slight decline would not be altogether unexpected.

The foreign markets are somewhat slow, particularly Great Britian, where conditions are in marked contrast to those prevailing at the close of last year. The decline is somewhat of a surprise to the dealers on this side, as prices were expected to have been at least equal to those ruling during last season, and it was anticipated that all available stocks at the opening of this season could have been easily placed, whereas very few cuts have been disposed of in advance for this season's trade.

Several reasons are attributed for this state of trade. General business in Great Britain is behind expectations, and the lumber and timber markets are naturally being affected thereby, while at the same time a good deal of cheap timber is being pushed in from the Baltic.

There is no doubt also that the freight rates are playing no small part in the difficulties experienced on this side. A more moderate and steady rate would do much towards removing the difficulty in meeting prices by placing the Canadian trade on a more equal footing with other producing centres.

Labour.—The supply of labour in Quebec for the approaching season is expected to be ample to meet all requirements. The previous season stood at a great disadvantage in this respect, as the supply of labour was insufficient. Wages, however, are keeping well up to last year's standard.

Pork Products.—All pork products at the present time are ranging on high levels, which in all probability will ease off and leave a firm market at somewhat lower and yet substantial prices. The supply of good hogs has been somewhat backward, to which is attributed the present high rates, but there are indications of a better run of the supply of hogs, thus leading up to a more solid market for packer's products.

Flour.—The recent fall in price of flour has acted as a stimulus to the present market. Prices, however, are expected to be firm to a higher level, at which they are expected to remain steady for the coming season.

Canned Goods.—Canned goods are in plentiful supply and are expected to be ample for all requirements. Prices will probably be maintained throughout the season.

Woolens.—In all woolen supplies there is a steadily maintained demand. Conditions will prevail similar to those of previous season.

Tools, Etc.—Tools and logging appliances are also meeting with an active demand, many manufacturers finding it difficult to keep pace with the anticipated demands. Prices are consequently firm, and there are little prospects of any weakening in these goods.

Horses.—The supply of good seasoned horses appears to be scarcely equal to meeting the existing demands for general trade purposes. Prices have steadily advanced for this class of animal, and it is not at all improbable that higher averages will have to be paid. This may not apply to the smaller class horse, although, generally speaking, horses are bringing prices in advance of previous seasons. This is in a large measure attributable to the heavy drain during the South African war, the market not having had sufficient time to recoup itself. Should there be any great increase of demand, it will be extremely difficult to find seasoned horses to meet that demand.

THE CAMP SUPPLY TRADE IN NEW BRUNSWICK.

St. John, N.B., April 30th, 1904.—In making a comparison of the cost of maintaining a lumber camp in New Brunswick during the past two seasons, we find last year to have been a more costly one to the operator than the season before, although there are many important lines that were less expensive. The chief factor is, of course, the wages of the men. During the winter just past, along the St. John River and its tributaries choppers received from $30 to $32 per month and teamsters from $22 to $25. During the logging season of 1902-03 choppers could be had at $28 to $30 and teamsters at from $20 to $23.

The operators in these parts do not expect any increase in wages next year, but rather that they will be lower. This is owing to the fact that next winter's cut of logs will be less than this year's, because of the large stocks that will be held over next winter owing to the shortness of the present manufacturing season. This will mean that there will be less demand for men, which condition will no doubt result in a reduction of wages.

Suitable horses are high in price and will in all probability continue to be so. A good horse that will answer the purpose will cost at present from $200 to $250, and they are very scarce even at these figures. For several years the price has been steadily advancing; during the last two years alone the cost has increased from ten to fifteen per cent. It is very improbable that they will be any cheaper during the coming season, the indications being that if there is a change at all it will be a further advance.

One branch of the business that has been more favourable during the season just past than in the preceding one is the price of camp provisions, as the following schedule will show:

	Fall of 1902.	Fall of 1903.
Pork, per barrel	$22.00 to $25.00	$15 00 to $18 00
Corned Beef, per barrel	15.50	14.00
Star flour	4.25	5.25
Beans, per bush	2.05	1.90
Molasses, per gallon	.33 to .38	.28 to .33
Sugar, per cwt	3.75	3 75

In the price of stable provender there has been little change. In the fall of 1903 feed was worth $24 per ton, cornmeal $2.85 per barrel, and oats 44 cents per bushel. The prices of a year earlier were practically the same.

In regard to the prices of any of the above lines it is almost impossible to make a forecast for next season, as there are so many circumstances that may govern the outcome that will arise in the meantime.

There has been very little change in the price of logging tools during the last two seasons. The prices paid in the fall of 1903 and which were practically the same as those of a year earlier are as follows :

Axes, single bitt, $5.50 per dozen ; double bitt, $10. Hand made axes, single bitt, $6 per dozen ; double bitt, $11. Peavies, No. 1 (handled) $13 per dozen ; handles, $2.60 per dozen.

The competition in axes on the part of American manufacturers does not greatly affect the price in this locality, and the prospects are, to quote the opinions of the largest dealers and manufacturers in these parts, that there will be little or no change in the price of tools during the coming season.

PATENT FOR A TIMBER RAFT.

Mr. J. G. Elderkin, of Fox River, Nova Scotia, has invented a new method of rafting timber, which will be understood by reference to the accompanying illustrations. The invention relates to rafts constructed of logs, piling, spars, poles, or other lumber, and designed for towing, particularly sea-going rafts which are required to withstand heavy strains, though also pertaining to those constructed for transportation in inland waters. The object of the invention is to provide a raft which will be very strong, being doubly bound together, and which will move easily through the water without chafing or injuring the timber or lumber. It is also the object to provide a raft in which the different grades of timber or lumber can be assorted and kept separate, said raft being built up of layers so arranged that when one or more of said layers are built the raft can be moved from the place it was commenced to any other place to be finished. In like manner it can be taken apart section by section without mixing the timber or that of one section with another, also parts may be removed without breaking up the raft as a whole.

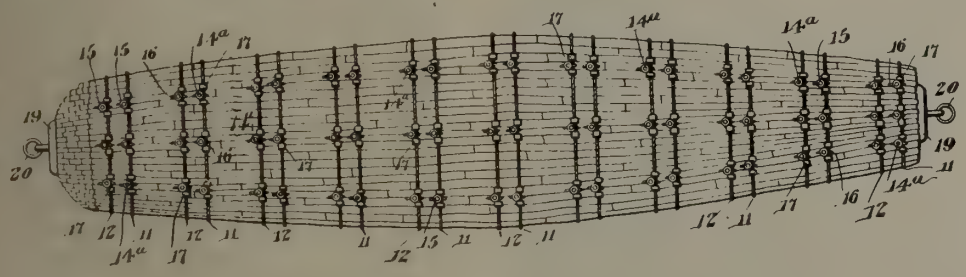


Fig. 1.

In the accompanying drawings Fig. 1 is a top plan view of a raft consttucted in accordance with the invention. Fig. 2 is a vertical sectional view through the ratt, on an enlarged scale, intermediate portions thereof being broken away, and Fig. 3 is a vertical cross-sectional view taken on substantially the line xx of Fig. 2. Similar reference-numerals designate corresponding parts in all the figures of the drawings.

The body of the raft, according to the claim of the inventor, is made up of separate independent sections that extend longitudinally of said body and are superposed one upon the other. In the present instance four of these sections are illustrated and designated by the reference-numeral 10, though any number may be employed, as desired. Each section is composed of timbers arranged end to end and having their joints disposed in staggered relation and therefore thoroughly broken. The sections extend from side to side of the raft, and each is fastened by separate binding-cables surrounding the same. Thus it will be apparent that each section is independent of the others, and should the upper one be removed the remainder will be intact. The several sections are also fastened together by raft-binder cables, which surround all the sections, and thus secure the body of the raft together as a whole. In the preferred form the body of the raft, as well as the sections, is substantially rectangular in cross-section, and to maintain this form, as well as to more thoroughly strengthen the structure, tie-cables pass vertically through the same. The lower ends of the cables are fastened to the lower transverse stretches of the raft-binder cables, and said cables pass vertically through the body of the raft. Their upper ends are fastened to stems, upon which are screwed tension devices in the form of nuts, having suitable handles. The tie-cables are fastened to the lower stretches of the lowest section-binder cables, and these tie-cables also pass vertically through the body of the raft, being connected to similar tension devices. Wherever the cables cross devices connect the same, these devices being so arranged that they will permit the relative movements of the cables. Extending centrally through the raft is a draft-cable, fastened at its ends to cap-plates that are arranged at the ends of the raft, said cap-plates being provided with suitable eyes, to which the tow-line may be attached. The raft may be constructed in any manner desired. For instance, in Fig. 3 there is illustrated cribwork. This, however, constitutes no part of the present invention.

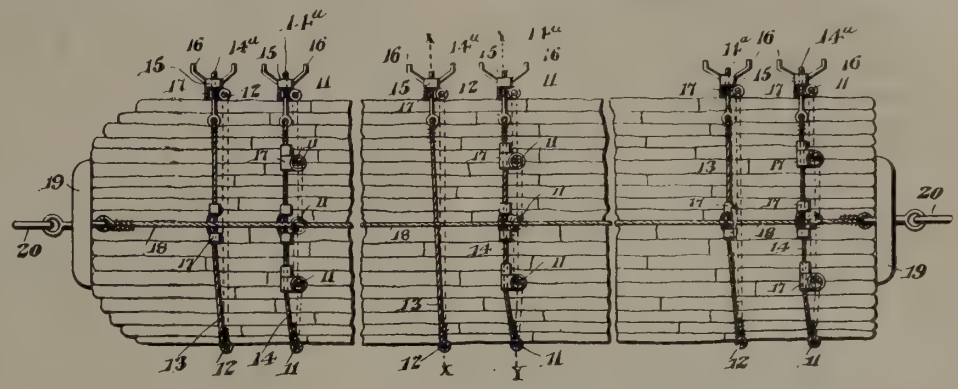

Fig. 2.

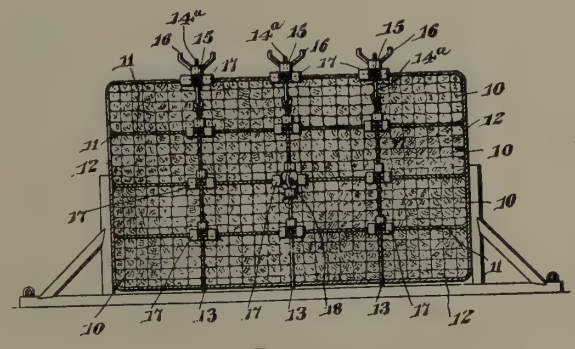

Fig. 3.

It will be apparent that a raft constructed in the manner described is doubly bound, each section being separate and yet secured to the others, so as to make a strong and rigid structure. The body is tied horizontally by the section-binder cables, so that it cannot spread, and the vertical cables also serve to hold said body in proper place. These cables may be tightened as desired by means of tension devices. A still further advantage resides in the fact that a raft may be constructed in sections and taken apart in the same manner without materially affecting the body as a whole. Furthermore, the different grades of lumber may be kept assorted and will not become mixed when the raft is broken up. While in the drawings the cables have been represented as "wire" rope, it will be understood that the term is broad enough to include chains or other suitable means of a similar character.

AMERICAN TIMBER IN GERMANY.

Kolnische Zeitung, a German commercial journal, says that imports of timber into Germany from the United States have more than trebled since 1880, amounting in 1902 to more than $5,850,000. It consisted mostly of pitch pine. This wood is more resistant to the weather and costs less than oak, which averages $3.47 per 35.3 cubic feet, while pitch pine costs only $1.66 for the same amount. Owing to its utility and cheapness the pine is handled in the most remote parts of Germany. It is used for making doors, windows, floors, etc., while oak is used in the manufacture of the finer grades of furniture.

It is stated that the first saw mill built on the Pacific coast was erected by the Hudson Bay Company, near Vancouver, Wash., in 1828. It had a daily capacity of about 1,000 feet.

One Copy, Weekly and Monthly, Six Months, in advance, 50
Foreign Subscription, $2.00 a Year.

ADVERTISING RATES ON APPLICATION.

THE CANADA LUMBERMAN is published in the interests of the lumber, wood-working and allied industries, being the only representative in Canada of these important interests. It aims at giving full and timely information on all subjects touching these interests, and invites free discussion by its readers.

Especial pains are taken to secure for publication in the WEEKLY LUMBERMAN the latest and most trustworthy market quotations throughout the world, so as to afford to the trade at home and abroad information on which it can rely in its operations. Subscribers will find the small amount they pay for the CANADA LUMBERMAN quite insignificant as compared with its value to them. There is not an individual in the trade, or specially interested in it, who should not be on our list, thus obtaining the present benefit and aiding and encouraging us to render it even more complete.

Advertisers will receive careful attention and liberal treatment. For manufacturing and supply firms wishing to bring their goods to the attention of owners and operators of saw and planing mills, wood-working factories, pulp mills, etc., the CANADA LUMBERMAN is undoubtedly the cheapest and most profitable advertising medium. Special attention is directed to "WANTED" and "FOR SALE" advertisements, which are inserted in a conspicuous position on front page of the Weekly Edition.

EXPORT OF NEW BRUNSWICK LOGS.

The Legislature of New Brunswick has just disposed of a resolution introduced by Mr. Flemming designed to prohibit the export of logs from the Province in the round or unmanufactured state. In support of his resolution Mr. Flemming argued that he was endeavoring to legislate for the future of the Province more than for the present, as the Restigouche and Western Railway, upon completion, would tap the St. John river at St. Leonards opposite Van Buren, Maine, and bring that town within forty miles of the best timber region in New Brunswick. He pointed out that the result would be that the timber cut above Grand Falls would go to the mills in Maine to be manufactured. The shingle business would also be seriously affected, as by manufacturing in the United States the duty would be escaped, which would be an advantage of $2.40 on each one thousand feet of timber, this estimate being based on the assumption that a thousand feet of cedar will make about eight thousand shingles.

After a preliminary discussion in the House, the bill was referred to a special committee. A large amount of evidence was given by prominent lumbermen, many of whom, it is noticed, were interested in lumbering operations in the United States. Mr. Todd, of St. Stephen, presented some interesting figures. He said that there are in New Brunswick about 7,000,000 acres of Crown lands, generally recognized as timber lands, and that timber is at present being cut on about 2,000,000 acres, the total cut of logs on Crown lands being about 150,000,000 feet annually. In his opinion, with proper observance of the regulations, the Province might cut 300,000,000 feet a year off its Crown lands for twenty-five years, and barring forest fires, have more standing timber then than now.

The opponents of the resolution argued that such legislation might disturb the present trade relations with the United States, that the lands above Grand Falls were mostly owned by private individuals and the New Brunswick Railway Company and hence would not come under the provisions of the law, and that as conditions now exist the balance of trade is largely in favor of New Brunswick, inasmuch as about 60,000,000 feet of Maine logs are manufactured by St. John mills annually.

The committee reported against the bill, on the ground that up to the present time the quantity of logs cut on Crown lands and exported to the United States had been very small, that considerable advantage was now accruing to New Brunswick through the manufacture of Maine logs at St. John, and finally that such legislation would result in very little advantage to the people of the Province, while it would work to the disadvantage of the operators and others engaged in getting out timber upon Crown lands.

The question of prohibiting the export of unmanufactured timber from the Province of New Brunswick is therefore deferred for another year. While such action probably best conserves the interests of the Province for the present, the time will no doubt come when the proper protection of home industries will demand that the raw material of the forest shall not be exported except in a manufactured condition. When that time is reached, the Government should not hesitate to act promptly and decisively. No consideration should be given to the argument that such a law might be regarded as irritating legislation which could be made an excuse for the adoption of retaliatory measures by the United States. The Ontario Government prohibited the export of both saw-logs and pulp wood without incurring any penalties from the United States, and this notwithstanding that the quantity of logs exported from Ontario to the United States was many times greater than that which is sent from New Brunswick. The Courts also upheld the Government in the contention that the right was reserved to impose new regulations affecting the cutting of timber on lands already under license, even to the extent of prohibiting the export of the timber.

TIMBER LIMIT OWNERS EXONERATED.

The oft-repeated cry that the lumberman is the foe of colonization meets a sweeping denial in the report of the Quebec Colonization Commission which was recently presented to the Legislature now in session, and which is referred to at some length elsewhere in this issue. One of the duties of this Commission was to inquire into the number and causes of the difficulties between timber owners and licensees and to advise upon methods for their prevention and removal. The Commissioners have spoken in a fearless, impartial manner. They have not hesitated to condemn the officials of the Government and even the Government itself where they consider censure justifiable. The report is, as a whole, a commendable document owing to its thoroughness, definiteness and impartiality.

The Commission found no grounds of complaint on the part of bona fide settlers, who neither complain of the law nor of the regulations; neither do they complain of those who hold licenses for cutting timber, while the latter, far from complaining of the bona fide settlers, want them and even look upon them as valuable helpers and protectors of their domain against the ravages of fire. There is stated to be no antagonism between the owners of timber licenses and real settlers or those who honestly take up public lands with the view of clearing them and not of speculating on the timber. Only one case of cutting timber on lots under location tickets and taken out of the timber licenses was found by the Commission, and in this instance it appears that the lots were taken and held for the benefit of the owner of a saw mill in the vicinity rather than for settlement purposes. This, however, did not justify the license-holder in cutting the timber after the lots had been taken out of his license. Many cases of alleged cutting of timber on settlers' lots were reported to the Commission, but beyond the one exception stated they were found not to be genuine, the persons making such claims being unable to produce any reliable evidence, which showed that they had taken for granted statements made without foundation.

In striking contrast to the above are the many cases of theft and fraud on the part of bogus settlers that came to the knowledge of the Commission. Forgery has been frequently resorted to in order to obtain possession of lands which were heavily timbered, in one instance an area of 1,500 acres or over two square miles being obtained in this manner.

The contention that no timber remains on the lots when they are handed over to the settlers is disproved by figures showing the quantity of timber cut by settlers in different localities. One or two examples will suffice. In twenty-two townships of Labelle region upwards of 28,000,000 feet were cut on settlers' lands during the season of 1902-03. In the St. Maurice region the license holders obtained from settlers over 12,000,000 feet of logs. Instead of the settler being deprived of his timber, he realizes a considerable sum by its sale, on account of the liberal settlement policy of the Quebec Government. The report states: "We are unable to obtain proof of a single case where a settler locating on a lot taken out of a license has failed to find wood enough on it to erect suitable buildings." The dissemination of false reports along this line is calculated to retard the progress of colonization, for the settler requires timber for his buildings and to enable him to earn a little money during the first year of his settlement.

The profits realized from speculation in lots fraudulently obtained are stated to be very large. One settler mentioned had as many as eighteen lots in his possession and resold not one of them for less than $200. This illicit speculation has reached such a stage that it actually imperils the existence of the industries of the country. The proprietors of pulp mills have found it difficult to raise capital for the extension of their plants solely because of the way their limits have been depleted within a few years under the pretext of colonization, and

the number of speculators in timber is stated to be constantly on the increase. This is the sole cause of the outcry that has been raised for some years past in regard to the pretended refusal by the Government to concede lots to settlers.

The Commissioners are of the opinion that the unsatisfactory conditions which exist are largely due to the inefficiency and neglect of the agents of the Crown Lands Department, and recommend that the Government take steps to reform the agency service with a view to bringing it up to the proper standard.

EDITORIAL NOTES.

What constitutes hard wood? was the question which was recently propounded to the writer. The enquirer was of the opinion that of the staple woods those which could be called hard wood in its true sense were ironwood, beech, and maple. He claimed that there were many others classes of timber which might be properly classed in the category of hardwoods, but which, strictly speaking, were not perfectly hard. Perhaps some of our readers who have given this matter a little thought will state their opinions on the point.

Friends of organization must feel encouraged at the growth of the Western Retail Lumbermen's Association of Winnipeg. The secretary's report to the recent annual meeting showed the membership to be 588, of which 498 are yard or active members, and 90 honorary members. There was an increase of 155 active and 27 honorary members during the last year. This would seem to be the strongest possible proof that the association is serving a useful purpose and that the members appreciate the advantages to be derived from a well-conducted organization. There is need of more organizations of a similar kind among the lumber trade of Canada.

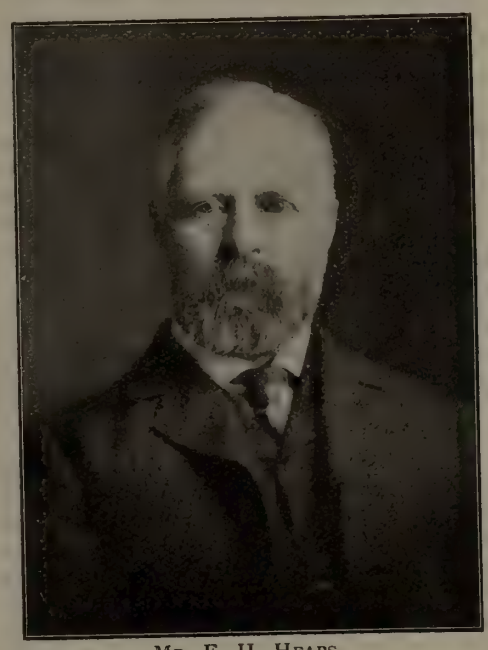
The recent announcement by the Ontario Government of their intention to formulate regulations permitting the cutting of hardwoods on Crown lands again suggests the necessity of taking some steps to place the hardwood lumber trade of this country on a more substantial footing. If we are to increase our export business it is essential that organized effort be made to remove some of the obstacles which are hindering the development of that business. One of these is the absence of standard inspection rules. Business is constantly going to United States shippers on account of their superior grading rules and more defined business methods. The Timber Trades Federation of the United Kingdom has just organized a Hardwood Section, at the inaugural meeting of which the question of rules for the measurement of lumber and securing uniformity in the measurement of round and waney timber was discussed. This section are working in conjunction with the National Lumber Exporters' Association of the United States, the result of which will doubtless be that agreements will be reached which will greatly facilitate the transaction of business in hardwood lumber. This will tend to further handicap the Canadian lumberman in making shipments to Great Britain, unless, of course, he takes steps to place himself on an equality with his American cousin.

PROMINENT BRITISH COLUMBIA LUMBERMEN.

Mr. E. H. Heaps.

One of the most important factors in the manufacture of lumber and shingles in British Columbia is the firm of E. H. Heaps & Company, which has a very large establishment at Vancouver and another at Ruskin, besides operating its own steamers and several logging camps. Of this concern, Mr. E. H. Heaps is senior partner and general manager. He is also President of the British Columbia Lumber & Shingle Manufacturers' Association. This, of course, is separate from the organization of lumbermen in the interior of the province, where they are formed into the Mountain Lumbermen's Association.

It is in connection with the B. C. Lumber & Shingle Manufacturers' Association that Mr. Heaps has been of particular interest during the last two months. He handles a large percentage of the local trade of Vancouver, which is no inconsiderable business when one knows that last year buildings to the value of



Mr. E. H. Heaps,
President British Columbia Lumber & Shingle Manufacturers' Association.

upwards of a million and a half were erected, and that so far in 1904 the amount in comparison with the same period last year has been doubled, with every prospect of a continuance. Mr. Heaps showed his independence when he declined to enter the selling pool which was being formed by the Association having for its objects the apportionment of all orders amongst the various mills and the making of all sales and collections through a central office. A large majority of the contractors who are members of the Builders' Exchange and honorary members of the B. C. Lumber & Shingle Manufacturers' Association were strongly opposed to the Centeral Selling Office. Mr. Heaps declined to entertain any proposition that was against the interest of the whole Association and the trade generally, and the announcement was made on March 20th that the formation of the selling pool was finally abandoned.

Mr. Heaps was born in the north of England near the shores of Lake Windemere, and was apprenticed for seven years to the well-known firm of Stead Brothers, cotton brokers, Liverpool. After spending three years in America, he returned to England and was engaged in cotton manufacturing in Manchester for eleven years, when he retired from business. He removed to Ontario, where he remained three years, removing to Vancouver about sixteen years ago. He has been connected with the lumber and shingle business in that province for sixteen years, and twelve years ago started in a small way the present establishment at Cedar Cove, now one of the largest in the province. Cedar Cove is a little bay in Burrard Inlet, at the extreme east end of Vancouver, and these mills are the centre of a veritable hive of industry. Cedar Cove has a post office of its own and several stores.

Twelve years ago, when the shingle market was just about to open up, Mr. Heaps commenced with two shingle machines. He paid close attention to business, making only a superior grade of shingles, and his trade grew. Now his business is not surpassed by any in the province, and the machinery has been so increased year by year that at present it comprises a modern saw mill plant, equipped with two band mills, Pacific Coast edger and gang mill, a shingle mill with room and power for twenty machines, a sash and door factory, planing mill, machine shop, etc. In addition, the firm operates several logging camps of its own, located in various parts of the Coast, and has two steamers to do its own towing, thus precluding the possibility of running short on timber in the times when brisk business monopolizes the services of all the towing craft.

In addition to the large plant in Vancouver, the firm owns and operates the mills at Ruskin, situated about 30 miles from the city at the confluence of the Stave and Fraser rivers, on the main line of the C. P. R. This branch is composed of a saw and planing mill, shingle mill, general store, etc.—in short, it is the town.

The success of Mr. Heaps can be summed up very briefly. He has always given close personal attention to business, and has been ably assisted by his partner, Mr. Wm. Sulley, and the managers of the different departments.

The subject of this article has made no pretence to prominence in municipal affairs, although taking an active interest in the welfare of the city at large. When he began business in Vancouver, the corporation was limited in its bounds, but he was one of those with the foresight to see that future years would bring great development. When the Board of Trade was organized in the ealier days of the city's history, one of the first members was Mr. Heaps, but owing to the rapid development of his business he has been unable to devote much time to outside interests.

NEW QUEBEC LUMBER COMPANY.

A company has just been organized for the purchase of 47 square miles of timber limits in the Charlevoix country. The land has been bought from Messrs. King Bros., Limited, of Quebec, and is supposed to contain some of the finest timber of the district. The company will be known as the Charlevoix Lumber Company, Limited, and will carry on a general lumber and pulp wood business. The directors are Messrs. A. I. Auger, E. Demers and F. D. Forest. The capital is $20,000.

REPORT OF THE QUEBEC COLONIZATION COMMISSION

Relations Between the Lumbermen and Bona Fide Settlers Perfectly Harmonious.—Startling Evidence Presented as to Wholesale Speculation in Timber on Pretence of Settlement.—Recommendations for Remedying the Evil.

The report of the Colonization Commission appointed by the Quebec Government has been presented to the Legislature and is a very important document. The duties assigned to the Commission were, in part, to make a critical study of the laws and regulations respecting public lands, woods and forests, and the protection of settlers; to enquire into the number and causes of the difficulties between settlers and holders of timber licenses, and to advise upon methods for their prevention and removal; to study the new proposal or systems which may be submitted to it, and, whilst taking into account the financial resources of the province, to recommend those which tend to amend the laws and regulations so as to foster colonization and the development of forest industries.

The final Commission was composed of Messrs. J. H. Legris, Chairman; J. C. Langelier, Secretary; John L. Brodieand P. N. Thivierge.

The report is divided into two parts, what has been ascertained and what is recommended. Extracts from the report are printed below.

The Commission found, practically speaking, no real grounds of complaint on the part of bona fide settlers. These settlers complain neither of the law nor of the regulations; neither do they complain of those who hold licenses for cutting timber, while the latter, far from complaining of the bona fide settlers, want them and even look upon them as valuable helpers, as faithful guardians and protectors of their domain against the ravages of fire. On this point we refer to the despositions of the limit-holders, especially those of Hon. Mr. Edwards, of Mr. J. R. Booth and of Mr. W. Price, the largest holders of timber limits. All have declared to us under oath that, instead of being the foes of the limit-holders, bona fide settlers are allies whom they need and who render them valuable services.

There is therefore no antagonism between the holders of timber licenses and real settlers or those who honestly take up public lands with the view of clearing them and not of speculating on the timber. On this point there can be no serious dispute based on facts occurring frequently enough to deserve being taken into consideration. Of course, there may be—we have even found some—isolated cases where the license-holders have been guilty of injustice towards bona fide settlers; but these are exceptions which only go to prove the rule.

It has been alleged that license-holders cut timber on settlers' lots even after the latter are taken out of their licenses. During the first inquiry held in Montreal, this charge was made by Mr. Carufel, secretary, and by Dr. Brisson, manager of the Colonization Society of that city. Nevertheless, when pressed by the commissioners to give facts in support of so serious an accusation, M. Carufel declared that he was unable to do so. Dr. Brisson cited a case in 1883 without specifying any details and could not give any more recent facts. The evasive replies of those two officers of the Colonization Society show clearly that they took for granted statements made wholly without foundation. The position they occupy gives to such stories a seriousness calculated to deter a great many who might otherwise be inclined to take up lands and settle on them. It is to be regretted that men, specially charged with the duty of furthering the colonization movement, should thus repeat, without being able to produce evidence of any weight, statements so calculated to impede the progress of that movement.

CUTTING TIMBER ON SETTLER'S LOTS.

The only serious case of cutting timber on lots under location tickets and taken out of the timber licenses is that in connection with lots 17, 18, 19, 20 and 21 of the 8th range of Amqui in Metapedia. After advertising the cancelling of these lots, the Crown Lands Department, on two successive occasions, granted the holders of location tickets a delay to enable them to comply with the regulations. During the delay and while the location tickets were still in force, a jobber of the firm of Price Bros. and for the account of the said firm began lumbering there last fall. During last winter 15,000 logs were cut, and, as he himself says in his evidence (Enquete at Quebec, deposition of J. A. Theberge), he would have cut 40,000 more had not his operations been stopped by threats of judicial proceedings on the part of the holders of location tickets.

To justify this proceeding, the contractor, Theberge, says in his evidence that the firm of Price Bros. had cleared the river; that the lots were taken and held for the benefit of the owner of a saw-mill in the vicinity. All this is probably true but it is nevertheless a fact that the license-holder unlawfully caused timber to be cut on lots taken out of such license and in the possession of the holders of such tickets.

This is the only case that has come to the knowledge of the Commission, in the course of all its investigations, of a license-holder having unlawfully caused timber to be cut on lots held under location ticket and taken out of a license.

IS TIMBER CUT BELOW REGULATION DIAMETER.

Another alleged ground of complaint set forth in the evidence and elsewhere, is that the license holders hasten to strip the lots of timber as soon as the latter are put under location tickets; in other words they remove all the timber, even that which they are not allowed to cut under their licenses.

This assertion is neither founded on nor justified by facts. A few cases occur in which the license holders, or rather their jobbers, cut down spruce of smaller dimensions at the stump, that is, two and a half feet from the ground, than is allowed by the regulations; but these cases are quite exceptional. In the course of lumbering operations in the forest it sometimes happens that, in cutting down a large tree, it catches in a small one which must also be cut down to allow the large one to fall. The small tree so felled is cut into logs and used although not of the regulation diameter. It must be admitted that it is better to use it than allow it to be wasted in the bush. Small trees are also cut to make skids on which the logs are piled. Formerly those skids were left in the woods and were lost; at present the employees of the Crown Lands Department compel the lumbermen to use them and take them away; they figure amongst the logs. At first sight the presence of those small logs amongst the large ones seems an infringement of the regulations, but it is incontestable that this practice should be encouraged instead of being blamed, for it is to the advantage of the public revenue and makes the most of this small timber which would otherwise be lost.

The places where the cutting of spruce smaller than the regulation diameter most frequently occurs are the region of the St. Maurice, that of Mattawin and the country in rear of Joliette. On several occasions the woods and forests branch has caused inquiries to be held upon complaints being made to that effect and in four cases out of five it was found that such complaints had no real foundation.

TIMBER FOR SETTLERS.

The stories about stripping the lots of timber are almost invariably spread by speculators disappointed in their schemes by the vigilance of the Crown Lands Department and its officers. Unfortunately these speculators are to be found in large numbers even among the real settlers. A man takes up a lot, makes enough improvements on it to protect himself against cancellation, but especially makes the lumber as quickly as possible or sells the cut, then abandons the lot to take up another elsewhere. If he fails to secure this other lot immediately, he cries out that he is ill-treated, that the Government is obstructing colonization by refusing to sell lots to settlers. There are even some who carry their spirit of enterprise to the length of changing districts, of moving from an agency, where they are too well known to further play this game successfully, to another where they are not known and where they can succeed more easily in carrying out their designs.

We are convinced that, by dint of repeating in every key that in the Province of Quebec only lots stripped by the lumber merchants are placed at the disposal of settlers, on which there does not even remain enough wood for the construction of farm buildings, considerable damage has been done to the progress of colonization. It is necessary to checkmate the deplorable campaign organized by speculators and represent things as they really are.

What we have ascertained in the course of our enquiries enables us to tell our fellow-countrymen in the United States and the people in the older parishes who are disposed to settle on Government lands, that they may be sure of finding thereon all the timber needed for building and even for sale to maintain their families during the first years, and such wood is annually increasing in value.

As regards the timber which remains for the settler, the most advantageous regions are unquestionably the valley of the Metapedia and the county of Bonaventure. The richness of the lots in this region, especially in cedar, is really extraordinary. Lots which yield 5,000 or 6,000 and even 10,000 logs of cedar and spruce, apart from birch and other wood, or 250,000, 300,000 and even 1,000,000 feet of merchantable timber, are not scarce.

SPECULATORS IN TIMBER.

The number of speculators in Government lots and in timber, already very considerable, is constantly on the increase. These interlopers are the scourge of colonization, a subject of continual trouble and an occasion of serious losses to the license-holders and the Government. The extraordinary increased value which all woods have attained within four or five years has caused this tribe to spring up in all parts of the province and their operations have assumed proportions which have become almost a menace to the legitimately conducted lumber industry.

The process adopted by these interlopers to create for themselves forest domains is of the simplest. Under the pretext of colonization, they get lots taken up by prete-noms or fictitious settlers, to whom they furnish the money to procure the location tickets. Before even the issuing of the ticket, in many cases, they get the cut of timber on the lot transferred to them for a trifle and the game is played. If the Crown Lands Department hesitates to concede the lot applied for, the speculator sets to work all the influences he can command. When all these intrigues fail to overcome the resistance of the Government, the disappointed speculator sets up the outcry that the Crown Lands Department is impeding colonization by refusing delivery of the public lands to settlers.

This is the great, the sole cause—so to speak—of all the outcry that has been raised for some years past in regard to the pretended refusal by the Government to concede lots to settlers. And we regret to be under the painful necessity of stating that the ever increasing phalanx of these speculators is recruited even from among the leading classes of society.

THE LAW RESPECTING FATHERS OF TWELVE CHILDREN.

In passing the law which gives to each father of a family of twelve living children the right to a free grant of one hundred acres of Crown lands, the Legislature had in view to stimulate the progress of colonization. The speculators, however, have managed to convert this patriotic legislation into one of their most effective weapons. In the Eastern Townships, chiefly, there are people who make a trade of hunting out the fathers of twelve children in all parts of the province and purchasing their rights. They prepare the papers prescribed by the law, carry on the correspondence, etc. The lot is sold to them in advance, generally for $30, and the

location ticket is transmitted to them as soon as issued by the Crown Lands Department. They select the lots themselves, which they get each father of twelve children to apply for, and it is needness to say that they choose only the most richly wooded lots, without concerning themselves in the least about their adaptability to farming purposes.

One of these organizations has presently before the Crown Lands Department applications for over 70 lots or about 7000 acres of woodland ; if these are granted at $30 each, these 70 lots will cost the speculator $2,100, and he will easily sell the timber on them for $20,000 or $25,000. That is to say that, with the aid of this law, which is intended to favor the progress of colonization, speculation has found means to practically revive the regime of the great land owners, which did so much harm to settlement in the Eastern townships.

RECOMMENDATIONS.

The recommendations of the Commission are in part as follows:

DIVISION OF THE LANDS.—The first measure necessary is the division of the public domain into settlement lands and merchantable timber lands. Let us include in the first category only the lands susceptible of profitable cultivation and let us leave the other in the peaceful and exclusive possession of those who work them for the timber. Then there will be no more antagonistic interests on the same property and each will know exactly the nature and extent of his rights.

PREFERENCE TO THE LICENSE-HOLDER.—To make this system practicable, safeguard the interests of the province and effectually put an end to the speculation in timber, a clause must be inserted in the location ticket stipulating that the holder shall be bound to give, for the sale of his wood, the preference to the holder of the license in which the lot is contained. There can be no reasonable objection to this clause on the part of the settler in good faith, since it takes from him absolutely nothing and causes him absolutely no loss. It is only the speculators, the traffickers in lots, the interloping traders, who might have anything to say against it ; but for these, there should be no mercy ; they are the plague of colonization, as well as of the timber trade carried on regularly and under legitimate conditions.

AUTOMATIC CANCELLATION.—Automatic cancellation will complete this reform and put an end to a host of frauds which do incalculable harm to serious colonization. The clamors of the negligent or the speculators are accepted as well founded complaints, and people, inclined to take up lots to clear them, frightened, diverted by these false outcries, relinquish the idea. The law must decree that, on establishment of the fact by affidavit of the Crown Lands agent or of an officer named for that purpose that the conditions, in whole or in part, of a location ticket have not been fulfilled, the holder of such ticket shall lose all his right to the lot, which shall revert to the Crown domain and be at once entered among the available lots in the agent's books.

IMMEDIATE REGISTRATION OF TRANSFERS.—The law does not prescribe any delay for registration of transfers of lots under location ticket. This is a want which it is important to supply, inasmuch as it gives rise to numberless frauds. The speculators take advantage of it to hold, with the help of prete-noms or unknowing accomplices, large numbers of lots; they keep in their own possession the transfers which they obtain, in order to guard against cancellation under the regulation limiting the number of acres of land which may be possessed by the same person. An article should be added to the law providing that every transfer of a lot under location ticket shall be transmitted to the Crown Lands Department within thirty days from its date, under pain of nullity, and that so long as this transfer has not been sent in, the lot shall remain the property and in possession of the vendor. We would be disposed even to recommend the imposition of a fine or a penalty for any infraction of this regulation on the part of the transferee. Lastly, it should be enacted that any person other than the holder of the location-ticket or the holder of the regularly registered transfer of the lot, making or causing to be made merchantable timber on a lot which is not in his name in the books of the agency or of the Crown Lands Department, shall be liable to a fine or to confiscation of the timber thus made, to the benefit of the Crown. Though they may appear a little severe, these measures are absolutely necessary to put an end to speculation in and plunderisg of the public lands on the pretence of colonization.

To protect the settler and the public revenue article 1342 should be amended and it should be enacted that any settler who makes or sells timber cut on his lot and does not send to the department before the 30th April the prescribed affidavit shall be ipso facto debarred of the right to claim the crediting or the refund of the stumpage dues.

Sworn reports, showing from whom the wood was bought, on what lots it was cut and where it was delivered, should also be required from saw mill owners, dealers in pulpwood and purchasers of ties. This is required from license holders, who are operating legitimately; why should it not also be required from speculators and interlopers, who are operating illegitimately? With the aid of such reports, it would be easy to protect the settlers and to let them get the benefit of the stumpage held back on the price of their timber.

LOTS OF FATHERS OF TWELVE CHILDREN.—The neglect to enforce the provisions of this law has given rise to frands, the number of which is daily increasing. In the Eastern townships, chiefly, this law has become one of the favorite weapons of the speculators. To remedy this, it is essential in the first place to pitilessly refuse to grant any lot on which there is merchantable timber, as prescribed by the law, and to add article 1267 the following provisions:

"The sale or alienation, otherwise than by donation inter vivos or by testamentary disposition, of a lot granted to a father or mother of twelve children or the sale of the privilege of cutting the timber thereon, entails the forfeiture of the grant, together with the confiscation of the lot to the benefit of the Crown."

FIRES FOR LAND CLEARING.—These are the most to be feared, the most frequent and the greatest occasion of damage to the forest. With a little organization and good will on the part of settlers, however, it would be possible to considerably lessen the dangers arising from them. Article 1345 of the Revised Statutes permits in a general way, for clearing purposes, burning at all times except between the 15th June and 15th September. Now, apart from the winter months, these three prohibited months are the least dangerous. The verdure at the foot of the trees prevents the fire from spreading, just as that of the foliage renders the latter harder to catch fire, especially in the hard woods. At that period the ferns, so inflammable before and after, constitute real "cut-fires," the rains are more frequent and the winds less strong, in fine everything contributes to lessen the danger by fire except in the pineries. The most dangerous season is the interval comprised between the 15th April and the 15th June. At that period as soon as the snow has disappeared, a few days of fine weather suffice to render extremely inflammable the rotten wood, the moss, the shrubs, and, above all, the ferns. A spark is enough to start a fire, which in a few hours passes beyond control. This is the danger time par excellence, the time when the fire-rangers should concentrate their watchfulness over the localities where they know that the settlers are land-clearing, especially when these clearings are in the immediate vicinity of a pine forest.

THE PROHIBITED FIRE SEASON.—The time during which it is dangerous to start fires in the vicinity of the forest varies so much according to climatic conditions, that it is impossible to practically fix it by law. In a same region, the snow disappears more quickly from the hills and the high ground than from the low ground ; it disappears also more quickly from the deciduous woods into which the sun early penetrates than from the spruce woods, whose close, thick foliage prevents the solar rays from reaching the soil. The mountain slopes are also more sensitive to the sun's action than the level lands. If the temperature is wet, and the weather rainy in the beginning of spring, the danger of fire is hardly to be feared. But it is just the contrary in a dry spring such as we had last year. It seems practically impossible to determine by law the period during which fires may be safely started in choppings and the matter should be left to the discretion of the fire-ranger, who, being on the spot and knowing the circumstances, would give permits to do so at the proper and safe time.

DIAMETER OF PULP WOOD.—According to the admission of experts black spruce is the best wood for pulp-making. This spruce attains only exceptionally more than eight or nine inches in diameter on the stump at thirty inches above the soil. To subject this wood to the rule applicable to the other kinds of spruce, white and grey, would be simply to consign it to an inevitable loss, since in reaching its maturity it would dry up and perish before attaining the diameter of 11 inches at the stump prescribed for the white and grey spruce. It was absolutely necessary therefore to allow a less diameter to permit its being utilized and turned to account for the revenue and for industry. There are localities, however, and notably at Lake St. John, where the best arable lands are covered with black spruce. In these cases it seems to us that it would not be fair to the settlers and assuredly to the public interest to not allow the license holders to cut black spruce trees of less than eight inches in diameter at the stump. Slight as it may appear, this change would assure to the settlers enough timber for building purposes.

DIAMETER OF CEDAR.—The regulations permit the license-holders to cut cedar trees of nine inches diameter at the stump. This is unquestionably too small. When the cedar of nine inches at the stump has been taken off, there remains for the settler nothing in the way of building timber and very little for fencing wood. The diameter for the license holders should be raised to twelve inches.

AT WHAT HEIGHT SHOULD THE DIAMETER BE TAKEN.—Formerly trees were felled with the axe and the cuttiug in this way was hardly possible at less than two or there feet from the ground. Within several years, this practice has been almost everywhere abandoned and the felling is done with the saw, which allows of the trees being cut at twelve or even six inches from the soil. In this way and without violating the letter of the regulations, the license-holder can remove all the timber fit for use on a lot, especially the white spruce, the yellow birch, and the cedar, and leave practically nothing for the settler. It would be advisable to clearly specify in the regulations that the prescribed diameter means the diameter at 24 inches from the ground.

RECOVERING SUNKEN LOGS.

Diving for saw logs is a new industry to be engaged in at Clear Lake, Mich., next summer by Messrs. J.W. McCaffrey and A. J. Boyer, of Union City, and Henry Dodge, of Cairo. They have just secured the title to the land on which this lake is located by purchase. It was the property formerly owned by Frank Toompson, now of Detroit, who conducted large lumbering operations on this lake 20 years ago. About 1,400 logs of the best timber are in shallow water, and it is estimated that at least 400,000 feet can be recovered by employing divers in the deeper parts. Most of the logs are clear white pine, and as they are water cured, a top-notch price is assured for the lucky owners.

FORESTRY AT THE ONTARIO AGRICULTURAL COLLEGE.

The Ontario Agricultural College is branching out in every department of agricultural education. Mr. C. A. Zavitz has been appointed to look after a plot of land which has been set apart for forestry near the Macdonald Institute building. Some thirty thousand seedlings will be planted, principally Norway spruce, white pine, white ash, basswood and sugar maple. These young trees will be ready for distribution among the farmers in the spring of 1905 and 1906. Mr. Zavitz will also attend to the distribution.

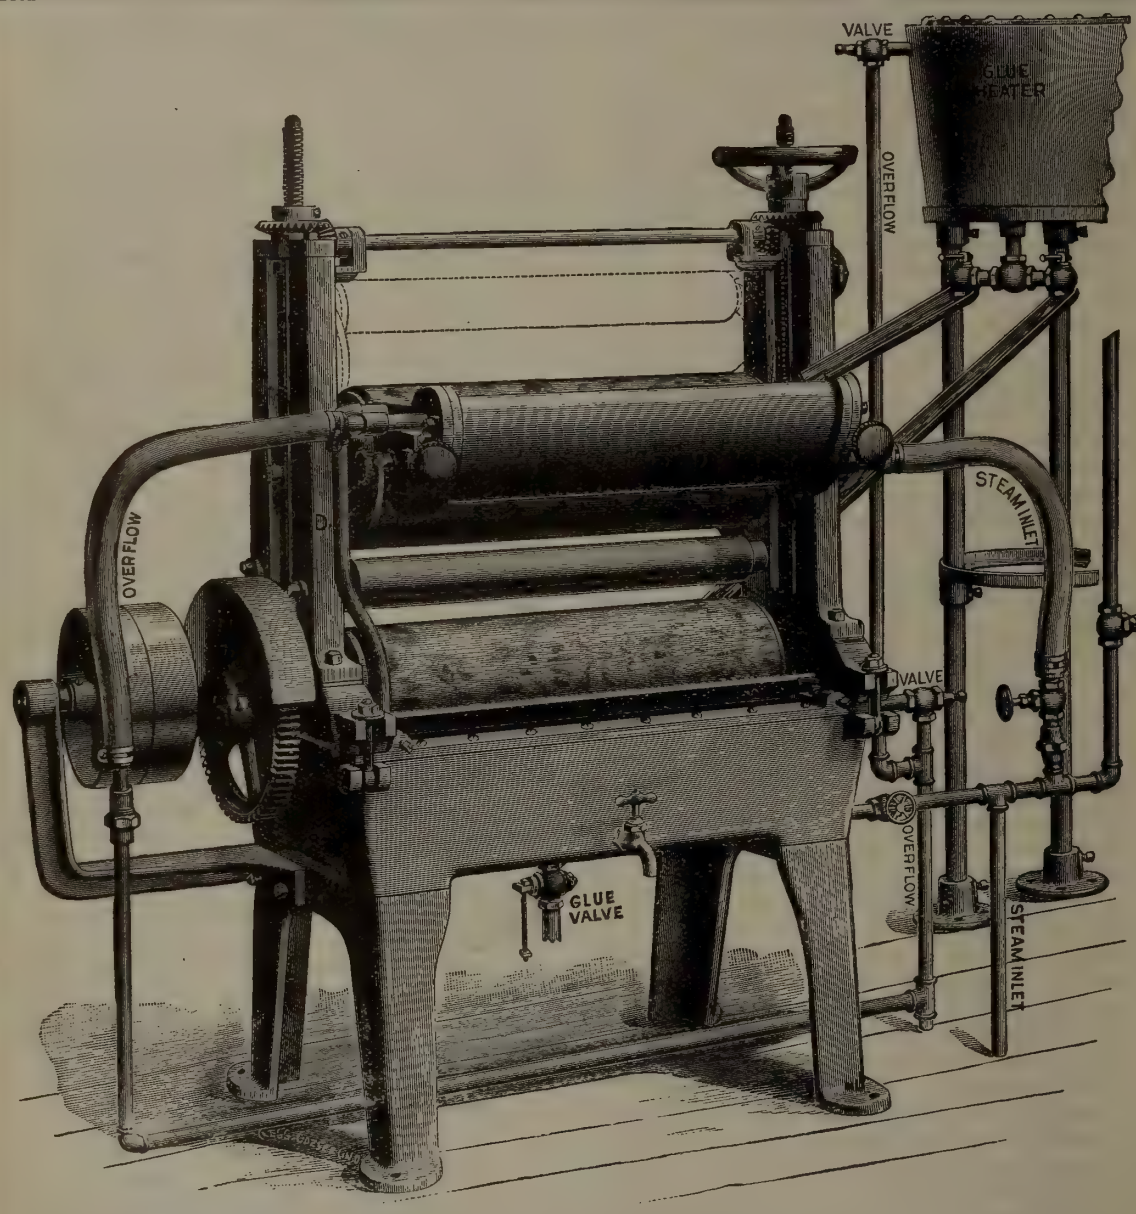
LUMBER DEMAND IN AUSTRALIA.

Mr. J. S. Larke, Canadian Trade Commissioner, Sydney, Australia, in his last report to the Department of Trade and Commerce, Ottawa, says: "Last year nearly fifteen million dollars were expended on buildings in Sydney. The building trade is a little quieter just now, though there are some large warehouses in course of construction. The timber market is somewhat upset by the rapid fall in prices on the west coast, accentuated by a decline in freights also."

FORESTS AND WATER SUPPLY.

The Colorado Forestry Association claims that every tree standing at an altitude of over 8500 feet means so many buckets of water during the hot, dry season, when there is no rainfall. Since the year 1900 there has never at any time been nearly enough water in the South Platte River to supply the water rights which are claimed in its waters. During these three years there are many water priorities which have not received one drop of water from this stream, because there was not sufficient water to reach around to them, while ten years ago they had a sufficiency. These are statements made by experts. Conditions are the same in all of the water courses flowing down the eastern side of the mountains, and on the western slope the conditions are becoming the same. Everyone understands that the forests in the mountains, especially in the altitudes above 8500 feet, hold the snow until late in the springtime, and often all through the summer, when in places even much higher, where there is no forest, the snow melts entirely away in April, and during the entire summer the streams which should be fed by beds of snow are dry. So serious has the situation grown regarding the destruction of timber of the mountains that United States Commissioner Henry Michelson has secured an agreement from the state land board that they will not sell any of the timber belonging to the state without notifying him and securing an expression of opinion from him as to the advisability of holding such timber to conserve the water supply.

The Gold Medal Furniture Manufacturing Company, of Toronto, have a modern wood-working factory situated on Van Horne and Dufferin streets. It has 7,400 feet of floor space and a dry kiln capacity of 100,000 feet per week. They manufacture flooring, sheeting, pine and veneered doors, etc.



Modern Glue-Room Appliances

COMBINATION GLUE SPREADER WITH BOILER IN POSITION

This machine can be used to great advantage in all wood-working plants where much "built-up stock" is used. It is simple, strong, well built, efficient and durable, and has all necessary adjustments which can be easily and quickly made. It is so constructed that very little time is required in changing it either to a single or double glue spreading machine.

The **LOWER GLUE TANK** is fitted steam tight into the hot water tank, which has all necessary steam and drain connections, the same as on our single glue spreading machines.

Glue is supplied to the upper roll by a **HOLLOW TROUGH CASTING,** the ends of which are packed steam tight, and the steam and water connections are made by means of the best grade of steam hose. This allows the trough to be raised or lowered without interfering with the steam joints. The trough is fitted in the journal boxes carrying the upper glue roll, so that it always remains in position for either thick or thin stock, and it is adjusted to or from the roll by means of hand-wheels shown in front of trough. In this manner the quantity of glue left on the roll can be regulated to suit the operator.

The hand-wheel shown at top of frame is used to raise or lower the upper glue roll, together with its glue trough and also the small idle roll. The cut shows the small roll in position to be used as a single glue spreading machine; and by removing two small thumb-screws and swinging roll into position, shown by dotted lines, the machine is ready to be used as a Double Spreading Machine.

The **Glue Rolls,** now furnished, are of our improved **corrugated** type.

A GLUE BOILER should be placed in position high enough to allow the glue to flow into upper glue trough as well as lower glue tank. The surplus glue in the upper glue trough flows to the lower glue tank through pipe "D".

These machines are built in seven sizes, taking in the following widths of stock: 12, 18, 25, 31, 37, 44 and 72 inches, and up to four (4) inches in thickness.

The loose and tight pulleys are 10x2 inches, and should make about 80 revolutions per minute.

We also make this machine as a Double Glue Spreading Machine only, without the small idle roll attached.

Our Special Catalogue No. 1284 of Modern Glue-Room Appliances shows Veneer Presses for all manner of work, various sizes and patterns of Glue Spreading Machines, Glue Pots, Heaters, Boilers, etc., Trestle Clamps and Double Clamps, and in fact everything required for the successful handling of Glued-up Stock. **Ask for Copy.**

CANADA LUMBERMAN

WEEKLY EDITION

The Lumberman Monthly Edition, 36 pages } $1.00 PER YEAR { The Lumberman Weekly Edition, every Wednesday

THIS PAPER REACHES REGULARLY THE PRINCIPAL LUMBER MANUFACTURERS AND DEALERS THROUGHOUT CANADA, AND WHOLESALE BUYERS IN GREAT BRITAIN, THE UNITED STATES, AND OTHER FOREIGN MARKETS.

VOL. XI. TORONTO AND MONTREAL, MAY 4, 1904 No. 14

CANADA LUMBERMAN

PUBLISHED BY

The C. H. Mortimer Publishing Co'y of Toronto, Limited

Confederation Life Building - TORONTO.

Branch Offices:

IMPERIAL BUILDING, MONTREAL.

22 GREAT ST. HELEN'S, LONDON, E. C.

The Weekly Lumberman — Published every Wednesday, contains reliable and up-to-date reports of market conditions and tendencies in the principal manufacturing districts and leading domestic and foreign wholesale markets. A weekly medium of information and communication between Canadian timber and lumber manufacturers and exporters and the purchasers of timber products at home and abroad.

The Monthly Lumberman— A 32-page journal, discussing fully and impartially subjects pertinent to the lumber and wood-working industries. Contains interviews with prominent members of the trade, character sketches and portraits of leading lumbermen, etc. Its special articles on technical and mechanical subjects are especially valuable.

WANTED AND FOR SALE

Advertisements will be inserted in this department at the rate of 15 cents per line each insertion. When four or more consecutive insertions are ordered a discount of 25 per cent. will be allowed. This notice shows the width of the line and is set in Nonpareil type; 12 lines make one inch. Advertisements must be received not later than 4 o'clock p. m. on Tuesday to insure insertion in the current week's issue

WANTED

Green Baswood Logs 10 to 30 in. in diameter, with bark on. To be delivered on cars.

HURDMAN & ELMITT,
Ottawa, Ont.

FOR SALE

MAPLE, BEECH, BIRCH and BASSWOOD

We have in choice winter-cut Northern Michigan hardwoods,

4/4 Maple	10/4 Maple
5/4 Maple	12/4 Maple
6/4 Maple	14/4 Maple
8/4 Maple	16/4 Maple

Beech. Birch, Basswood, too. Also some Elm, Ash us. Favorable freight rates to Canadian points. BROWNLEE & CO., Detroit, Mich.

For Sale

2 Cars Basswood, 1 inch 1sts and 2nds.

1 Car Soft Elm, 1½ and 2 inch 1sts and 2nds.

1 Car B. Ash, 1 inch 1sts and 2nds.

Cut July-August, 1903; immediate shipment. Apply Box 111, CANADA LUMBERMAN.

FOR SALE—BIRCH, ABOUT 500 M; MAY be cut to order. Box 134, CANADA LUMBERMAN, Toronto.

FOR SALE—WHITE PINE UP TO 60, HEM lock to 30, to saw to order into large timber Box 127 CANADA LUMBERMAN, Toronto, Ont.

WANTED—1" AND 5/4" SOFT MAPLE C & B, 1" Cull Hemlock and Pine, 1" and thicker Hard Maple and a mixed stock of dry Hemlock. R. E. KINSMAN, Hamilton, Ont.

FOR SALE—70 H.P. FIRE BOX BOILER with Water Front, good for 100 lbs. steam pressure, cheap for quick turn-over. Address, Machinery Exchange, 22-24 Victoria Square, Montreal, Que.

WANTED — TEN THOUSAND CORDS Hard and Soft Wood; also same quantity of Slabs. SIMCOE WOOD AND LUMBER CO., 52 Yonge Street Arcade, Toronto.

FOR SALE

ABOUT 600,000 FT. HARDWOOD LUMBER, to be sawn during the summer, consisting of Beach, B. Ash, W. Ash, Basswood, H. Maple. S. Maple, Elm, etc. Would contract and saw to order. Address, Box 43, Vienna, Ont.

To Practical Lumbermen.

FOR SALE — SAW MILL IN BRITISH Columbia, near Vancouver, whole or half share. Capacity 12,000 feet per day, 3,000 acres timber land adjoining, more available; 3 acres freehold land, price $35,000 for the whole; time payments, if desired. Principals only.

A. P. JUDGE, Box 613. Vancouver, B. C.

MORTGAGE SALE

Of valuable manufacturing industry known as The Parkhill Basket Company, Limited, at Owen Sound on May 18th at 2 30 p. m. Splendid site, water and railway facilities; saw-mill and factory buildings and machinery in first-class condition. For further particulars apply to

MACKAY, SAMPSON & TELFORD,
Owen Sound.

PULP WOOD

Correspondence with a reliable firm who can supply Spruce pulp wood. Can sell large quantities at good prices.

J E. Harroun & Son,
Watertown, N.Y.

Peeled Basswood

Those having Dry Peeled Basswood to sell will find it to their advantage to write us before selling. We use several hundred cords yearly, and are now in the market for immediate or spring delivery.

DELANEY & PETTIT CO.
Limited, Toronto

WANTED — PAIR OF SECOND HAND Knight Dogs, right and left. Address Box 224 Chesley, Ont.

WANTED FOR CASH—BROWN ASH, 3" Spruce. Dimension stock. THE BEARSE LUMBER CO., 88 Tremont St., Boston, Mass.

WANTED, TO ENGAGE TWO SAWYERS and one fireman for coming season's work. Apply to GODERICH LUMBER CO., Goderich, Ont.

FOR SALE ON CANADA ATLANTIC RAILway, one 55 H. P. Boiler, one 45 H. P. Engine. Apply THE MCGILLIVRAY COMPANY, Ottawa.

A1 DOUBLE AND SINGLE CUT BAND Filer, wants position; good Canadian reference. Address Box 133, CANADA LUMBERMAN, Toronto.

FOR SALE

200 M. ft. Spruce flooring, 200 M ft. White Pine and 200 M. ft. Hemlock. Apply Box 139 CANADA LUMBERMAN, Toronto.

WANTED—A PORTABLE SAW MILL TO saw about one million feet of saw logs, consisting of Hemlock, Basswood, Maple, etc., in Simcoe County, Tossoronto Township, in vicinity of Lisle Station. Apply M. BRENNEN & SONS COMPANY, Hamilton, Ont.

FOR SALE — IN CAR LOTS, SEVERAL cars each of X, XX and XXXX 16" Cedar Shingles; well cut and carefully packed. Specially recommended as the best cedar shingles manufactured in Ontario to-day. Inquire of D. S. PRATT, Midland, Ont.

WANTED

ONE MILLION FEET INCH NO. 2 WHITE Pine Mill Cull Sidings. Shipments arranged. State quantity you have with price and shipping point. Also Hardwood lumber of all kinds. Mixed carloads shipped if necessary. Address Box 138 CANADA LUMBERMAN, Toronto.

LUMBER WANTED

WANTED FOR IMMEDIATE DELIVERY, a stock of Dry 7" Hemlock Joisting from 4" up to 12" and from 10 ft. to 20 ft., anywhere from 20 M. to one Million ft. Apply, GOLD MEDAL FURNITURE MFG. CO., LTD., Toronto.

FOR SALE

2,000 acres of Hardwood Land in Antigonish County, N. S., close to railway sidings. The James River runs through the centre of 1,250 acres. Apply to

J. S. O'BRIEN,
Antigonish, N. S.

FOR SALE

FIRST-CLASS TIMBER LIMITS IN BRITISH Columbia; over 600,000,000 ft. cedar, fir and pine. Easily handled. Best bargains in the province.

L. D. KEAN,
Box 385, Edmonton, Alberta.

LUMBER WANTED

5 cars 1s and 2s Soft Elm, 1"x6" and up, 20 cars 1"x12" and up, 14/16 feets.
2 cars Clean White Ash Poles 3¼x5, all 14 feets.

THE UNDERSIGNED HAS FOR SALE four thousand Telephone Poles, in all lengths, from 25 to 60 feet. Prices quoted by mail or wire for any number. Apply CHARLES DESMARAIS, Box 284, Hull, Quebec. Telephone 2177.

CURRENT TRADE CONDITIONS.

ONTARIO.

The better weather over the entire province has been of material benefit in all lines of business and in lumber in particular. The opening of navigation has facilitated the movement of stock; there has been resumption of work at the mills, and altogether greater activity is displayed. The rebuilding of the burned district in Toronto is under way, and this, with the increasing demand for houses and store property, promises to result in heavy building operations and a large consumption of lumber. The railways have been unable to move but a small portion of the sold lumber at the mills, and last week were compelled to refuse to accept lumber shipments owing to the great danger to the culverts and embankments caused by the spring freshets. While there is nothing approaching a lumber famine in Toronto, the supply is comparatively light and prices are held very firmly. The principal demand appears to be for cheap building lumber, as these grades in shipping condition have passed almost entirely out of first hands. Speaking provincially, the market is no more than holding its own. Buyers are waiting in the hope that manufacturers' prices may decline. In some quarters reports of a break in values are quite common, but investigation would indicate that such reports have emanated from sources where the wish has been father of the thought. The lists of the large mill men show absolutely no decline, nor are they willing to give

concessions of consequence to effect sales. It is our opinion that there will be no significant drop in white pine prices this summer.

Hardwoods are experiencing a good factory demand, in which birch is the leader. Soft elm also sells readily. There has been liberal buying of hemlock lumber on the basis of $12 to $12.50 at the mills.

QUEBEC AND NEW BRUNSWICK.

The spruce situation is not entirely void of hope. Manufacturers are receiving an increasing number of enquiries for stock for shipment to the Eastern States, where the supply of dry spruce lumber is scarcely equal to the demand. While there is no improvement in British business, the loss in this trade will be offset in part by larger shipments to the Eastern States, if events bear out the present outlook. The leading market feature this week is the decline in lath prices in New York, to which point large consignments have recently been made. The decline ranges from twenty-five to fifty cents and has caused a very irregular market. American laths are quoted at St. John at $2.05 to $2.10, and provincial laths at $1.80 to $1.85. A recovery from these prices will no doubt occur in the near future, as the lath market in general is firm. Cedar shingles are showing a little more strength but prices are not quotably higher. For Boston delivery best grade New Brunswick cedars bring from $3.30 to $3.40.

The outlook for stream driving operations in New Brunswick has materially improved. The ice is now out of the St. John river and the work of driving is to be commenced this week. The river has risen quickly during the past few days, and with the large quantity of snow which still lies in the upper woods there is likely to be a sufficient depth of water for driving for some time to come. From present appearances the 40,000,000 feet of last year's logs will reach the mills safely and conditions are favorable for getting out the new cut also.

MANITOBA AND BRITISH COLUMBIA.

From the standpoint of demand and consumption, the lumber market of the North-West is in a healthy condition. Building permits to the value of over $2,000,000 have already been taken out in Winnipeg this year, and in the leading British Columbia cities and towns active building operations are in progress. It is estimated that between one hundred and two hundred residences will be built in Vancouver before the rainy season sets in next fall. The lumber dealers in Manitoba and the Territories are making preparations for a large trade, the mills having received an unusual number of orders within the past fortnight. Great difficulty is being experienced, however, in filling orders owing to the shortage of freight cars. This is no doubt due in part to the recent tie-up of traffic by the slides in the mountains. Many of the orders, also, are going to the mills across the border, and the importation from that field promises to be very heavy this year, to the detriment of the business of the Canadian manufacturers. The British Columbia mills are now unable to ship lumber into Washington, the collectors of customs having added to the import duty on lumber the amount of the alleged export tax imposed by the British Columbia Government on timber, making the duty on some grades of lumber as high as $7.50 per thousand feet. The British Columbia lumbermen have again requested the Dominion Government to take steps to remedy the unfair conditions which now exist, as a result of which many mills are considering the question of closing down. That such conditions should exist in the face of an active lumber demand calls for immediate action on the part of the Dominion Government.

UNITED STATES.

There has not been the increased activity in lumber which was expected upon the advent of spring weather. The demand is rather spasmodic and some dealers are quite apathetic. The result is that a few holders of stock are exhibiting some anxiety to realize, causing indications of weakness in certain districts. Concessions granted have been confined to narrow limits, and in white pine to the higher grades. Coarse lumber is about one dollar higher than last year, this being the result of the abnormal demand for box-making purposes. The building requirement has not yet presented itself in full measure, but there will no doubt be a heavy demand from this source during the next few weeks, as the outlook for building is considered good. The feeling at Buffalo and Tonawanda is moderately hopeful. The opening of navigation is welcome, as nearly all the box and low grade pine is in the hands of the box-makers. Our list this week shows a slight advance in the price of pine box.

The hardwoods are holding their own. Birch is a leader in point of demand and the supply is comparatively light, while basswood and maple, which are inquired for quite liberally, are in more plentiful supply, and an occasional report is heard that prices are a little less firm. Thick stock is difficult to find in any quantity.

Shingles are still dull and prices show no tendency to improvement. The same may be said of laths, although white pine laths are considered good property.

GREAT BRITAIN.

The tone of the British lumber market is slightly improved, the recent failures having lost their effect to some extent. Better weather has stimulated building operations and there seems to be less apprehension of a further decline in prices. Contracts for c. i. f. delivery cannot yet be closed on basis of shippers' ideas, but the seller and buyer appear to be getting a little closer together. Spot prices are holding up well, as merchants are beginning to realize that the difference between the price of lumber on hand and that asked for delivery this year does not warrant them in sacrificing their stock. The course of prices, however, largely depends upon the question of demand, and should a steady improvement take place during the next few weeks, the pessimistic feeling which has been so prevalent would soon pass away.

At a recent public sale in London 3 x 11 inch spruce deals brought £8 15s. to £9 for second quality and £8 for thirds. First quality Quebec pine deals also sold somewhat low, but the lumber was scarcely up to grade.

BROOM HANDLES

If an enterprising man with supplies of cheap Spruce, Basswood or Poplar care to put in several machines to work broom handles we can take his output. Write in first instance to Empire, care of CANADA LUMBERMAN.

STOCKS AND PRICES.

The Rathbun Company's drive on Nogey's Creek, consisting of 150,000 pieces, has started from Swamp Lake, Galway.

McKee Bros., of Paisley, Ont., have over 600,000 feet of logs at their mill for sawing this season, consisting of hardwood, cedar, hemlock and pine.

The Spanish River Lumber Company took out about 16,000,000 feet of logs last winter, which will be manufactured at Spanish River by the Huron Lumber Company.

It is estimated that about 10,000,000 feet of bank logs will arrive at Springhill, N. B., this season. The price of round logs is $11 to $11.50, compared with $13 one year ago.

The City Council of St. John, N.B., last week awarded contracts for supply of spruce and hemlock deals and planks and spruce paving blocks. Spruce deals and hemlock plank will be supplied by J. M. Driscoll, at $11.95 and $9.90 per thousand feet respectively. Hilyard Bros. will supply the hemlock deals at $10.50. Paving blocks will be obtained from C. T. White at 45 cents per yard, and T. E. Sayre at 50 cents per yard.

Messrs. A. F. & D. Mackay, of Liverpool, England, recently sold at auction 230 logs of fresh birch timber, which realized an average of 1s. 6d. per cubic foot; 18 inch and upwards brought 1s. 9½d; 17½ in., 1s. 7d; 17 in., 1s. 6¾d; 16½ in., 1s. 6½d; 16 in., 1s. 6¼d; 15½ in., 1s. 5½d; 15 in., 1s. 5d; 14½ in., 1s. 4½d; 14 in. and under, 1s. 3½d. A second parcel, consisting of 120 logs of bright floated birch timber from St. John, brought the following prices: 19½ in. and upwards, 1s. 11½d; 18 and 18½ in., 1s. 8½d; 17½ in., 1s. 7d; 17 in. 1s. 7d; 16½ n., 1s. 6½d; 16 in., 1s. 6¼d; 15½ in., 1s. 5½d; 15 in., 1s. 5¼d; 14 in., 1s. 4½d. A small quantity of maple, ash, and elm timber sold at 1s. 2d.

NEW BRUNSWICK LETTER.

(Correspondence of the CANADA LUMBERMAN.)

ST. JOHN, N. B., April 28th, 1904.—During the last few days the New York market for laths has taken a decided slump. This was very unexpected and was caused by heavy arrivals of Maine laths during the last ten days, probably from twelve to fifteen millions having been received. American laths are worth today, f.o.b. St. John, from $2.05 to $2.10, and Provincial from $1.80 to $1.85 per M.

The dealers in this vicinity seem to feel that the depression in laths will be only temporary and that the situation will improve rapidly as soon as some of the surplus has been worked off, but at any rate the market is very unsettled and it is impossible to make a forecast with any certainly of being correct.

The Fredericton Boom Company, of Fredericton, N. B., succeeded in placing the last of their booms in position on Monday last. About 2,500,000 feet of spruce and cedar logs had run past before this operation was completed. Several tugs, together with strings of booms and large crews of men, have been waiting at Gagetown in charge of Mr. Fred Myles in ant c-ipation of this emergency, and they have already succeeded in securing all the logs that came. The manufacturers expected at least five million; and possibly ten, and are accordingly greatly elated because of the favourable way in which the thing has turned out.

Messrs. Donald Fraser & Sons, lumber manufacturers, are moving their head office from Frederiction to St. John, where they will occupy a handsome suite in the Canada Life Building, Prince William St.

BRITISH COLUMBIA LETTER.

(Correspondence of the CANADA LUMBERMAN.)

VANCOUVER, B.C., April 27, 1904.—Commercial conditions in connection with the lumber industry in British Columbia are not very encouraging at the present time. Prices are fluctuating, tending to a lowering if anything, and the demoralization of the market in the Northwest Territorities and Manitoba is working great injury to the mills. Mr. C. M. Beecher, vice-president of the Hasting mill, known as the B.C. Mills, Timber & Trading Company, has announced that that large establishment will close down. Export trade has fallen off to some extent, and this has been one of the chief factors in the business of this mill since its beginning. This combined with the ruination of the Northwest market has completed matters, and unless conditions materially change other mills are operating for a shut-down. Logs are plentiful, and as soon as the Pacific Coast Lumber Company cuts its supply, it too will close for an indefinite period. Mr. J. G. Scott, the manager, fixes the date about September 1st.

The mills in Washington state have tremendously overcut, and some of the shingle mills there have already been closed down. The lumber manufacturers have issued circulars to those engaged in the trade here, asking them to close down until the present supply is got rid of, or say one day per week to curtail production. It is on account of the great quantity on hand in Washington that British Columbia lumbermen are suffering. The banks in that state force the mills to pay up, and as a result they have to sacrifice their cut. To save their own market they ship at cut prices to the Canadian Northwest, and the market there is flooded with rough lumber to the great detriment of the trade of this province. The Government so far has refused the duty asked for, thinking it in the interests of the settlers that this should continue, but it only means a convenience to the American producer who is amply protected in his own country, and a forcing of inactivity upon the British Columbia mills, which may perhaps result in failure to a large number unless relief comes soon.

CANADIAN LUMBER SHIPMENTS.

From Halifax, N.S.: Steamer Pretorian, for Liverpool, 153,724 ft. hemlock deals, value $1,740; 64,058 ft. birch deals, value $657; 1,712,309 ft. spruce deals, value $19,674. Steamer Manchester Trader, for Manchester, 142,276 ft. hemlock deals, value $1,269; 317,819 ft. spruce deals, value $3,884.

TIMBER LIMIT TRANSACTIONS.

R. McGregor, of New Glasgow, N. S., has purchased the timber limits and mill property of the late C. W. Lantz at Milford, N.S. The purchase price was $29,500.

James A. Moore, of the Moore Investment Company, Seattle, Wash., is negotiating for the purchase of 100,000 acres of timber lands on Vancouver Island, B. C., belonging to the Esquimalt and Nanaimo Railway Company.

The Seattle Cedar Lumbering Company, said to be the wealthiest lumber company in the world, has purchased what are known as Stinson's limits, in the Ucluelet district of British Columbia, and also acquired a large block of timber licenses in Clayuquot district, in all about 60,000 acres. The company now has surveyors in the field blocking out its limits, a work which will take four or five months to complete, and it is reported to be the intention to build mills at suitable points and begin the manufacture of lumber for export. Lumbermen look upon this transaction as of the greatest interest and importance from the fact that it secures to one firm a very considerable portion of the merchantable cedar on Vancouver Island.

We own and operate several mills in Washington and British Columbia, being on both sides of the "Imaginary Line" known as the International Line, and it keeps our opponents in the trade guessing how to meet us on account of the good quality of our manufactured stock, which has been so carefully planned that even the selection of our timber lands in years past has something to do with the present.

We find our competing salesmen's story to the customers has now got to be a "song pure and simple," which they have learned from necessity to sing loudly and lustily, and is as follows: **"JUST AS GOOD AS HASTINGS," "JUST AS GOOD AS HASTINGS."**

While we appreciate their holding our goods as models of perfection, which the high standard certainly merits, still looking at the matter from the customer's and the consumer's standpoint we cannot see any advantage to you in buying an imitation when the real article can be had through our representatives, viz;—

James Tw tchell, Clinton, Ont., for Ontario, Canada

OBITUARY.

Mr. Claude McLachlin.

Mr. Claude McLachlin, who died in New York on the morning of April 19th, was a member of the firm of McLachlin Bros., of Arnprior, Ontario. He was born in Ottawa in 1854, and was the youngest son of the late Daniel McLachlin, one of the pioneer lumbermen of the Ottawa Valley, who as far back as the early forties was heavily interested in the square timber trade, and to some extent in the sawn lumber business in Ottawa. In 1853 Mr. Daniel McLachlin purchased the water powers at the mouth of the Madawaska river and the land on which the town of Arn-

The Late Mr. Claude McLachlin.

prior now stands, and in 1857 moved up from Ottawa to Arnprior with his family. In 1866 he erected the first saw mill to saw lumber for the American market in that place. In 1869 Mr. Daniel McLachlin retired from business, leaving the work to be carried on by his three oldest sons under the style of McLachlin Bros. Before 1876 two of the members of this firm died and in that year Mr. Claude McLachlin entered into partnership with his elder brother, Mr. Hugh F. McLachlin, who survives him, and the business has ever since been carried on under the old name McLachlin Bros.

At the time of the foundation of the new partnership the business was entirely a Madawaska one, but as timber became scarcer on that river a large steam saw mill was erected on the bank of the Ottawa at Arnprior, which could be reached with logs from all the tributaries of the upper Ottawa as well as from the main river itself. In 1893 the firm found it necessary to meet the demands of their expanded business by building another steam mill a short distance from the first one.

Owing to the great extent of the business carried on by the firm of which he was a member, Mr. McLachlin was of necessity brought into contact with the great majority of those who are interested in the lumber trade of Canada, and though a man possessed of a markedly quiet manner, and of a rather retiring disposition, he had a faculty of obtaining the esteem of all with whom he had business relations, as was evidenced by the large number of prominent business men, especially those connected with the lumber trade, who followed his remains to the grave in the Arnprior Cemetery.

His loss will be very deeply felt and lamented by all those with whom he was most closely connected, by his home town, in whose welfare he always took an active interest, and also by the lumber trade at large as long as energy, ability and integrity are looked upon as the foundation stones of a wise and successful business career.

Mr. Samuel Chew.

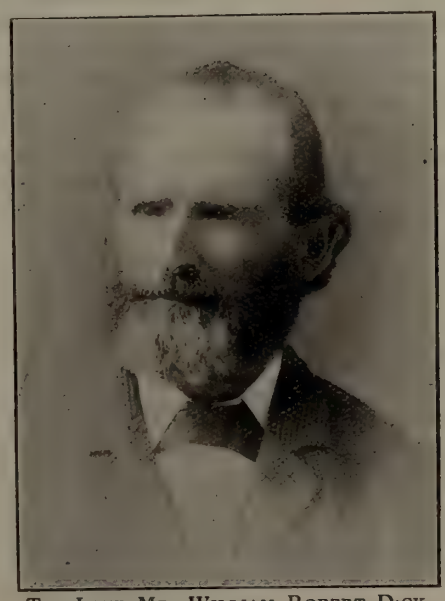
Mention of the death of Mr. Samuel Chew, of Midland, Ont., which occurred on March 20th last, was inadvertently omitted from our April issue. Mr. Chew was one of the early poineers of Midland. He was born in the County of York in the year 1840, and for a number of years was engaged in the lumber business south of Orillia. He removed to Midland twenty-nine years ago, where he continued in the lumber business for eight or ten years, when he purchased a farm in the Township of Tay just outside the corporation of Midland, where he resided with his family until his death. Deceased had enjoyed the best of health throughout his life until about two years ago, since which time he gradually failed, death being finally due to an attack of paralysis. He was most highly respected, being of a very kindly and charitable disposition. Five brothers and six sisters survive him, the former being George, Thomas, and William, the well-known lumbermen of Midland, Joseph, of Vancouver, B.C., and Fred, of Apto, Ont.

Mr. Thomas Cole.

The recent death of Mr. Thomas Cole, of Westboro, Ont., removed one of the pioneer lumbermen of the Ottawa Valley. Mr. Cole was born in Devonshire, England, in 1820, being therefore in his eighty-fourth year. He came to Canada when quite young and was attracted into the lumber business, first locating at Papineauville, Que., and taking out square timber on contract. Later he entered the employ of Mr. Allan Gilmour, who was at that time probably the heaviest timber operator in Canada. He was appointed manager of his business on the Nation River, and in this capacity became widely known throughout lumber circles. Some years later he became a partner of the late James McLaren, of Buckingham, Mr. J. C. Edwards and Mr. Daniel Cameron in a firm which acquired the Gilmour timber and saw mill interests on the Nation river. This firm did business at the North Nation Mills until 1878, when through the death of Mr. Cameron the business was wound up. Shortly after this time Mr. Cole bought the Thompson farm and homestead at Westboro, where he lived for the balance of his days. He leaves a wife, four sons and five daughters.

Mr. William Robert Dick.

Mr. William Robert Dick, a pioneer lumberman of Winnipeg, Manitoba, died at his residence, 436 Edmonton street, on Thursday evening, March 31st, after a brief illness, at the ripe old age of 83. He was born



The Late Mr. William Robert Dick.

at Kingston, Ont., on December 31st, 1821, and when a boy moved with his parents to the Township of Fenelon, in Victoria County, Ont., where he was brought up. He served as Reeve of the Township for several years, as well as serving on the County Council. In the early days of 1871 he traced his way west and in the following year removed his family to Winnipeg.

Mr. Dick's first business was that of lumbering, and he built a saw mill at the foot of Lombard street on the banks of the Red River. The late W.W. Banning went west at the same time as Mr. Dick, and from their acquaintanceship through being fellow travellers in the early days, they became partners in the lumbering venture, the firm being called Dick & Banning. In 1875 they took up timber limits on the east shore of Lake Winnipeg, and built a large saw mill, which was kept running at full capacity manufacturing lumber for the growing little city of Winnipeg and vicinity.

In 1881, the C.P.R. having just been built east as far as Rat Portage, making it possible to ship lumber in from the Lake of the Woods district, and the city as well as the country west experiencing a wonderful boom, the firm bought out the wholesale lumbering and manufacturing business of the late W. J. McAulay at Keewatin. In 1893 the mills at Rat Portage and Norman amalgamated under the charter of the Rat Portage Lumber Company, since which time the late Mr. Dick led a retired life at his home in Winnipeg.

Mr. Dick was elected a member of the Legislative Assembly of Manitoba in 1874, representing Springfield for one term as a Liberal, after which he retired from public life, although solicited on several occasions to again enter the field as a candidate for municipal and provincial honors. He was a member of the First Baptist Church, Winnipeg, being one of the seven constituent members when the church was organized in 1873 by Pastor McDonald. Mr. Dick was married in 1843 to Isabella, daughter of Robert Willcock, of the Township of Mariposa, Victoria County, Ont., who died in 1899. Three sons and three daughters survive.

Mr. Joseph Nadeau.

Mr. Joseph Nadeau, head of the Port Daniel Lumber Company, of Port Daniel, Que., died in the city of Quebec on March 26th, from pneumonia, after a short illness. He was only thirty-three years of age, and was a popular and energetic business man. He leaves a widow and two children.

PERSONAL.

Mr. C.E.Sands, late of the Vancouver Daily Ledger, has accepted the position of manager of the Hazelmere Lumber Company, Hazelmere, B. C.

Mr. A. W. Featherstone, lumber dealer of Listowel, Ont., has been chosen as one of the bowlers to go to the Old Country in May. He will be absent three months and will visit England, Scotland and Ireland.

Mr. James Fitzsimmons, of Irishtown, N. B., is now eighty-five years of age, and of the eighty-five winters which he has seen the last sixty have been spent in the lumber woods. During the past winter he had charge of a camp. He is still hale and hearty.

Mr. A. E. Dyment, M. P., of the lumber firm of N. & A. Dyment, Thessalon, Ont., has been unanimously chosen as the Liberal candidate for the Dominion Parliament for the new riding of East Algoma. He has also been elected president of the East Algoma Liberal Association.

Many congratulations were received by Mr. J. R. Booth, the veteran lumberman of Ottawa, who on April 5th last celebrated his seventy-seventh birthday. Mr. Booth is enjoying excellent health, and during the past long, hard winter he did not even contract a cold. Mr. Booth was born at Waterloo, Que., going to Ottawa fifty-one years ago, since which time he has been engaged in the lumber business on his own account.

PUBLICATIONS.

The Seaforth Engine & Machine Works, of Seaforth, Ont., have issued an attractive catalogue setting forth the advantages of the new "Bell" automatic engine.

"The Mechanic," a journal of interest to machine wood-workers, reaches our desk regularly. It is published monthly by the H. B. Smith Machine Company, of Smithville, N. J.

The Robert Bell Engine & Thresher Company, Seaforth, Ont., in a catalogue specially devoted to engines, show illusrattions of their No. o saw mill carriage and saw frame. They also point ont that they are agents for the Sawyer belting, which is made from duck and constructed so as to give the greatest possible strength and the least possible stretch.

The Hastings Shingle Manufacturing Company, of Vancouver, B.C., advise us that the saw mill they are building at Moodyville is intended for the manufacture of high-class lumber.

TIMBER SLIDE TOLLS.

The following judgment, given in the King's Bench Divisional Court, by Chief Justice Street, is of interest to all persons owning or using improvements on rivers or streams :

IN RE. BECK AND THE ONTARIO LUMBER CO.—This was an appeal by the Ontario Lumber Company from an order of the Judge of the District Court of Nipissing made upon the application of the C. Beck Manufacturing Company, Limited, under Sec. 13 of R.S.O., Ch. 142, fiving the tolls upon logs floated by the Ontario Lumber Company through a stream called Post Creek, upon which the applicants had made certain improvements.

At the hearing on the 16th December, 1903, before the learned District Judge, after some evidence had been taken a verbal arrangement was entered into between the parties for the purpose of empowering him to fix provisional tolls, which were to be corrected at a later stage in the proceedings, when further necessary particulars had been obtained.

The learned Judge, however, proceeded sbortly afterwards to deliver his judgment, absolutely fixing the tolls ; and the Ontario Lumber Company appealed, upon the grounds, amongst others, that the learned Judge had not carried into effect the agreement of the parties ; that he had charged the Ontario Lumber Company with tolls upon logs which had been floated down the stream before the tolls were fixed, and that in fixing the tolls he had taken into consideration certain improvements alleged to have been constructed by certain persons named Pelton & Reid who were formerly interested in a portion of the limits affected, and to have been purchased by the C. Beck Company from them.

On February 17th the appeal was argued before a Divisional Court composed of Falconbridge, C.J.K.B., and Street and Britton, J.J., A. B. Aylesworth, K.C., and A. G. F. Lawrence for the appeal. H. E. Hodgins, K.C., contra.

March 16th, Street J.: In the course of the trial the learned District Judge seems to have suggested to the parties, and they seem to have agreed, that he should be permitted to fix provisionally a rate of toll taking as the basis for it the plaintiff's statement of the cost of the improvements on the river, and the quantity of logs which the two parties and any other persons had passed over them, or would probably pass over them during 1904, the date of toll so fixed to be revised and corrected upon other data being obtained, and the parties to pay or refund according to the revised figures ; the defendants insisting that this agreement should not be taken as an admission of the Beck Company's right to take the Pelton & Reid improvements into account, nor his right to recover tolls for any period earlier than the season of 1904, nor that the Beck Company were owners of the Pelton & Reid improvements, nor the value of those improvements.

The learned Judge after hearing further evidence as to the cost of the disputed improvements and the title to them, and as to the number of logs run over the improvements during 1901, 1902 and 1903 by the Beck Company, and the quantity estimated for 1904, made an absolute and unqualified order fixing a rate of forty cents per thousand feet board measure as the rate of toll to which the Beck Company were entitled, without specifying whether it was to be applicable to logs floated down by the Ontario Lumber Company in the past as well as the future, or in the future only.

The Beck Company claim upon the argument that it was intended to apply both in the past and the future.

The Ontario Lumber Company appealed upon the ground that the learned Judge had disregarded the terms of the agreement at the trial under which they had abstained from giving evidence as to their past and intended cut. There was in fact no evidence given on the part of either of the parties as to the proportion which the cut of the Ontario Lumber Company in the past and the logs which remained uncut upon their limits bore to the cut of the Beck Company and to the logs remaining uncut upon the Beck Company's limits. Nor was any evidence given to show what logs had been passed over the improvements by Pelton & Reid while they owned the improvements.

The learned Judge in his order says : "In the absence of any evidence on the part of the respondents, I find that the improvements and constructions for floating and transmitting saw logs or other timber on said Post Creek are used by the applicants and respondents only, and by them in equal proportions."

This finding, however, is made in the absence of any evidence on the part of either the applicants or respondents, and as the rate of toll has evidently been fixed upon the finding set forth it should not be allowed to stand. The applicants, the Beck Company, were bound to support their application for the fixing of toll by evidence upon the points referred to in the finding, if those points were material, as no doubt they were, and no tolls could properly be fixed in the absence of such evidence.

Then I think the learned Judge has not acted upon the consent given at the hearing, which is only intelligible if it means that no final judgment is to be given upon the application until inspection of the improvements has been made and other particulars obtained, and that in the meantime a provisional rate should be fixed by the judge and acted on by the parties subject to correction upon the final judgment being given when differences between the provisional and final tolls should be adjusted. The proposed arrangement is by no means clear, nor can its intention be ascertained with certainty ; but the parties appear to have abstained from giving some evidence upon the understanding that the tolls to be fixed were merely provisional and they should be put back to their former position.

With regard to the Pelton & Reid improvements, the agreement between Pelton & Reid and the Beck Company of 27th March, 1901, is sufficient to transfer them to the Beck Company. Their cost, however, or their value are not the only elements to be taken into account when they are brought in as part of the material upon which tolls are to be fixed.

It should further be ascertained what quantity of logs had been passed over them by Pelton & Reid themselves before the transfer to the Beck Company. Suppose that these improvements had been made in the first place by the Beck Company and that they had also owned the Indian Reserve timber limit upon which the improvements are situated, and had cut down and floated down the improvements all the timber upon the Indian Reserve, it is plain that in fixing the tolls to be paid by persons up the stream for subsequently using these improvements it would be proper to take into account the use already made of them and the benefft derived from them by the Beck Company in respect of the timber on the Reserve ; and the position of their assignee of the improvements cannot be any better under the Act than that of the person who originally made them. This element has admittedly not been considered in fixing the tolls.

Upon the construction of the Act R.S.O., Ch. 142, I cannot find any authority for the position that a person who has made improvements upon a stream can obtain from the District or County Judge an order fixing tolls to be paid upon logs which have been floated over them previous to the making of the order. A contrary interpretation would entitle the owner of the improvements to go back for six years and recover tolls fixed in 1900 upon logs floated down in 1894 for instance.

The reasonable tolls payable under Sec. 11 are to be taken as being those fixed under Sec. 13, and they are chargeable upon all logs going down after the tolls are fixed. The provisions of Sec. 19, under which a lien for a summary method of collecting tolls, are given, show that the tolls mentioned in the Act, in accordance with the nature of tolls in general, are definite sums, ascertained in the manner provided by the Act before the logs became liable to them.

There is no hardship upon the owner of the improvements in so holding, because the proceeding before the judge is of a most summary character and may be made by him at any time.

It appears, therefore, to be necessary that the appeal should be allowed, and the order of the learned Judge should be set aside with costs, without prejudice, however, to a further application by either party to him to fix a proper rate of tolls to be taken for the future by the Beck Company, upon the further evidence necessary.

Falconbridge, C. J., and Britton, J. J., concurred.

SUPERIORITY OF BRITISH COLUMBIA SHINGLES.

We have always maintained that the British Columbia red cedar shingle was a superior article in respect to manufacture, the reason for which probably lies in the fact that until recently the business was confined to a few enterprising manufacturers who a few years ago set themselves to work to carve out a market for B.C. shingles. Their motto seemed to be excellence of manufacture. How well they have succeeded is shown by the large number of new mills which have since been built, but more strikingly still by the admission which has just been made by the Interstate Red Cedar Shingle Company, which is the selling pool for the shingle mills of the State of Washington. This company has issued to mill owners a warning which contains the following :

"We find the market for Washington red cedar shingles is in danger from Redwood and British Columbia shingles on account of their superior quali ies in manufacture and packing. Eastern lumbermen are criticizing our shingles and we must improve our grades. We believe you should immediately advise your filers, sawyers, knotsawyers and packers that this matter of poor grades is serious and is actually responsible for much of the decline in prices. The above statements are not exaggerated, and unless manufacturers and their employees use more care in getting out well-made and carefully packed shingles, other goods will get our market."

It must be a source of gratification to British Columbia millmen to know that their efforts to produce a first-class article are appreciated by the trade and that buyers are discriminating against those mills which turn out an inferior grade of shingle. It is this consideration which has enabled them to market their product in the United States even in the face of an import duty. It is to be hoped, however, that the British Columbia manufacturers will not rest on their laurels, but that they will continue to endeavor to produce an article which will have no rival. The large number of new mills which have lately been built in British Columbia is a source of danger in this respect, and it might be advisable for the British Columbia Lumber & Shingle Manufacturers' Association to especially impress upon their members, as well as those outside the association, the advantages of maintaining a high standard of quality for their product.

THE NEWS

—C. Street has opened a retail lumber yard at McGregor, Man.

—Joseph Dent is building a new heading mill at Bothwell, Ont.

R. Kalo, of Arkona, purposes building a cooperage shop at Milverton, Ont.

—W. Oliver has purchased the plant of the Cardston planing mill, Lethbridge, N.W.T.

—The Wetaskiwin Sash & Door Company, Limited, has been incorporated at Wetaskiwin, N.W.T.

—Isaac Murphy, Fox Warren, Man., has sold his hardware and lumber business to John Dunsfield.

—E. D. Bentley, planing mill, Medicine Hat, N.W.T., has been succeeded by Bentley & Humberstone.

—The Miniota Lumber & Grain Company, Miniota, Man., has been incorporated, with a capital of $50,000.

—The North-West Lumber Company are building a saw mill at Ponoka, N.W.T., estimated cost $10,000.

—The Candadian Timber & Sawmills, Limited, expect to have their new mill at Trout Lake City, B.C., completed this month.

—The firm of McConnell & Watson, lumber merchants, Hamiota and Crandall, Man., has been dissolved.

—The Royal City Mills, New Westminster, B.C., have recently built a new dry kiln 66 x 116 feet, as well as a warehouse 66 x 100 feet.

—M. H. Beatty, of Toronto Junction, Ont., has purchased 800 acres of timber land near Sundridge, Ont., and will engage in the lumbering business.

—The firm of Weiler & Son, saw millers, Formosa, Ont., has been dissolved. Chris. Weiler will carry on the business in future.

—The capital stock of the Rat Portage Lumber Company, Rat Portage, Ont., has been increased from $500,000 to $2,000,000.

—The Digsbury Lumber Company have taken over the business of Kirkpatrick & Company at Digsbury, N.W.T. Tromb Bros. will build a sash and door factory at the same place.

—T. Mowatt, representing A. Haslam, Nanaimo, B.C., has established his headquarters at Calgary, N. W. T., from which point he will push the sale of B.C. cedar and other lumber in the Territories and Manitoba.

—J. D. McRae, of Eganville, Ont., has leased the Knight saw mill and property at Fourth Chute, and will operate both the Eganville and Fourth Chute mills this season. His limits are located on the Bonnecherre river.

—The Hazelmere Lumber Company recently completed at Hazelmere, B.C., a large mill for the manufacture of rough and dressed lumber, shingles, etc. The machinery, which was supplied by N. Thompson & Company, of Vancouver, is of modern design. The mill is located 18 miles from New Westminister and less than 3 miles from the boundary line. The manager is George M. Thrift.

—Garfield & Scaffer are building a saw mill on Sechelt Inlet, B.C., for the manufacture of cedar. The Gower Point Timber and Logging Company are building a mill on Keats Island, Howe Sound, for a similar purpose.

The new factory which the Woodstock Lumber and Manufacturing Company will build on the corner of Canterbury and Huron streets, Woodstock, Ont., will be of brick and stone, 56 x 100 feet, two stories and basement.

—George Morin, the thirteen-year-old son of Peter Morin, of Hull, Que., was drowned last month in a tail race at J. R. Booth's mill. A rapidly revolving chain caught the sleeves of his coat and pitched him headlong into the river.

—The Manufacturers' Lumber Company, Limited, Stratford, Ont., has been incorporated, with a capital of $40,000, to deal in lumber. The directors are A. J. McPnerson, Alexander Faill, J. A. McFadgen, J. L. Kastner, and Royal Burritt.

—The Canadian Elevator Company, Limited, of Winnipeg, have take over the retail lumber business of Van Wart & Company at Calgary, N.W.T. William Stewart, who has been manager of the latter company, will retain his position with the new concern.

—The Cascapedia Manufacturing & Trading Company, whose act of incorporation is now before the Dominion Parliament, have purchased 400 miles of timber limits in the Bonaventure district. It is understood to be their intention to build saw and pulp mills.

—Robert Moore has made application to the City Council of New Westminster, B.C., for a fifty-years' lease of the foreshore and land west of the Lulu Island bridge known as Dock Square. He proposes to erect a saw mill to cost $50,000 and employing fifty hands.

—It is reported from Vancouver, B.C., that Mr. Merrill, an American lumberman who owns 50,000 acres of timber land in British Columbia, and James Dunsmuir, will join issues in testing the constitutionality of the law placing a tax on timber exported from the Province.

—The annual meeting of the Muskoka Wood Manufacturing Company was held at Huntsville, Ont., last month. The directors elected subsequently chose the following officers: President, Dr. J. W. Hart; vice-president and manager, R. J. Hutcheson; secretary-treasurer, T. S. Parkinson.

—The Robb Lumber Company, Limited, was recently incorporated at Guelph, Ont., the provisional directors being Gregory Kloepfer, Jacob Kloepfer, F. Frank, Thomas Griffin and J. H. Hewer. The company has a capital of $40,000 and is authorized to conduct a lumbering business in all its branches.

—R.W. Wood and A.B. Trite, of Fernie, B.C., have purchased the saw mill property of the Hayes Lumber Company at Elkmouth, for a consideration in the neighborhood of $26,000. The business will be conducted under the name of the Elkmouth Lumber Company. Mr. Wardrop, of Sparwood, has been engaged as manager.

—Mr. William Russell, of Matane, Que., reports under date of April 18th that the weather in that locality was still very cold with winter roads, and all streams and rivers very low. There was, however, plenty of snow, so that with mild weather and some rain no difficulty in connection with the drives is anticipated.

—Hon. G. E. Foster, of Toronto, William Irwin, of Peterboro, and other eastern capitalists, recently purchased a large saw mill at Kamloops, B. C., from the Ashcroft Water & Electric Improvement Company. The purchase includes timber limits on Shuswap Lake. The same parties recently acquired other timber interests in the Okanagan district.

—E. L. Kinman was a short time ago awarded a contract to get out a large quantity of logs for the Canadian Timber & Saw Mills Company, of Vancouver, B.C. We are told that Mr. Kinman will adopt a new method of taking out timber. The limits lie along the lake, and he purposes placing a large donkey engine on a barge, which can approach near the shore. From a windlass a cable half a mile in length will extend, and when the logs have been cut into suitable lengths, they will be "snaked" into the water with this apparatus. It is thought that the method will work successfully.

—The McAllister Company have recently completed a new saw mill at Hawksville, Ont. The building is 50 feet square, with a smoke stack 75 feet high. The engine, 50 horse power, and the boiler, 60 horse power with 52 flues, were supplied by E. Leonard & Sons, of London, Ont., and the saw mill equipment proper by the Waterous Company, of Brantford. The company have a considerable quantity of logs on hand and expect a busy season. They will manufacture cooperage stock as well as lumber.

—"Toredoes will not look at a turpentine pile" is the statement made by Mr. Fyfe Smith, who reached Vancouver, B.C., recently from Australia. He says that piles are made 50 feet long from the turpentine tree of Australia, and without being doctored are put into the water bark and all. The peculiar properties of the turpentine wood are objectionable to the toredo, and he gives the piles a wide berth. Mr. Smith has located in Vancouver with the object of introducing Australian hardwoods to Canadians. He will represent the Allan Taylor Company, large lumber exporters of Australia.

Two catalogues of interest to the woodworking trade have been issued by Messrs. Hammacher, Schlemmer & Company, of New York City. The first is No. 225 and is entitled "Saws and a Few Saw Sets." The second is No. 226 and refers exclusively to planes. These catalogues are unique in that tool houses do not ordinarily issue separate catalogues of these lines. They are also quite comprehensive, and as they are distributed gratuitously we would suggest that any person interested should write the company for a copy. Their address is 209 Bowery, New York.

CRAIG MINE CRYSTAL CORUNDUM WHEELS

Our Pure Crystal Corundum Saw Gummers have no equal for their rapid, cool, cutting properties.

Read the following from Bulletin 180 of the United States Geological Survey, which says:

"Often a distinction is made between emery and corundum, many persons not recognizing emery as a variety of corundum.

Emery is a mechanical admixture of corundum and magnetite or hematite. It is, of course, the presence of corundum in the emery that gives to it its abrasive qualities and makes it of commercial value, and the abrasive efficiency of emeries varies according to the percentage of corundum they contain."

Emery is imported, mined by Greeks and Turks and contains only about 25% corundum. Our Crystal Corundum is guaranteed to be 98% pure alumina, a Canadian product, mined and manufactured by Canadians for Canadians.

HART CORUNDUM WHEEL COMPANY, Limited, Hamilton, Ont., Can.

THE Wood-Worker and Retailer

LETTER TO THE PRESIDENT.

The following letter was addressed to the president of the Western Retail Lumbermen's Association by Mr. D. E. Sprague, of Winnipeg, who was obliged to be absent from the city when the annual meeting was held on March 23. It refers to a meeting of manufacturers held in Winnipeg a few weeks previous to the convention of retailers:

My Dear Mr. Campbell:

I regret exceedingly that owing to your recent illness you were unable to be present and preside at the meeting recently held here of the Honorary members with those of the Active members who were able to attend.

At this meeting large and influential delegations were present representing the manufacturing interests both at the Coast and in the Mountains. From the trend of the discussion, it would appear that the Honorary members in British Columbia had become imbued with the idea that the retail dealers were receiving excessive profits, and were in consequence responsible for the agitation and criticisms aimed at the lumber interest in the Northwest generally, and that their interests were prejudiced by the greed of the Active members. It was amply demonstrated, and I believe convincingly, that apart from a very few isolated instances, where exceptional conditions prevailed, the profit obtained by the retail dealer was not more than that allowed by the by-laws, viz., 20 per cent., and it rarely exceeded 15 per cent., surely as small a margin as will profitably maintain any lumber business. This information went towards strengthening the good feeling between the Honorary and Active members. Knowing their own margin of profit and having satisfactory evidence of the reasonable profit of the retailer, they were forced to the conclusion that the consumers of lumber in Manitoba and the Northwest procured their supply of lumber as cheap as it was possible to furnish it. So far as the cost properly belonging to the manufacturer and retail dealer was concerned, the only other factor entering into the cost of lumber to the consumer is the charge for transportation. To this last item of cost the delegations, therefore, directed their attention, with what success we have had some intimation.

The net result of the conference seems to have been to promote the most friendly feeling between the two classes of members, and to stimulate the loyalty of both to the Constitution and By-Laws of the Association; but more important still, so far as the resident public and the incoming settlers are concerned, was to establish beyond successful contradiction the fact that lumber can be procured in Manitoba and the Northwest Territories at retail as cheap, if not cheaper, than in Minnesota and Dakota, notwithstanding the fact that the largest source of the pine supply is located in Minnesota, and that the territory served is much nearer the point of production than that covered by our members.

The operation of the Association so far as regulating prices within proper limits, maintaining suitable stocks and the dealing of the Active members with the public, was justified in the minds of the Honorary members, and it gives me pleasure to be able to tell you that they were not slow in expressing their satisfaction and admitting that the information upon which they had formed their earlier opinions had been misleading and incorrect; as statements made regarding the Association generally are.

I regret exceedingly that I shall be unavoidably absent from the meeting. I shall, however, be deeply interested in the proceedings.

Trusting that you may have a profitable and satisfactory session, and looking forward to again addressing you as President, I am, with kindest regards,

Sincerely Yours,

D. E. SPRAGUE.

MR. N. A. RHODES.

Mr. N. A. Rhodes, vice-president of Rhodes, Curry & Company, Limited, manufacturers and builders, Amherst, N. S., is a self-made man in every sense of the word, having lost his parents at an early age and being thrown on his own resources when ten years old. He was born in Amherst, N. S., in 1845. After learning the carpenter trade he went to the United States, where he remained for ten years, during five years of which he held a responsible position as superintendent with a large building and contracting firm.

MR. N. A. RHODES,
Vice-President Rhodes, Curry & Company, Amherst, N. S.

In 1877 Mr. Rhodes returned to Amherst and engaged in the manufacture of building materials. Later he took into partnership his brother-in-law, Mr. N. Curry, who is now president of Rhodes, Curry & Company, Limited. The business of this company is varied in character and includes operation of saw mills, planing mills, lath mills, shingle mills, brick works, car works, machine works and foundry. The figures of the business speak for themselves and need no further comment. The total business transacted in 1903 was $2,700,000; wages paid, $483,000; freight paid, $154,567.54.

Mr. Rhodes also holds large interests in other enterprises. He is half-owner in a large lumber concern at Sheet Harbor, N.S., where he and his partner, Mr. Curry, are operating on a large scale. He held a large interest in a Newfoundland lumber property, which was recently sold to a Boston firm for a large figure. He is also interested in other lumber properties.

Mr. Rhodes is a director of the Misaquash Marsh Company, which has been reclaiming a large block of over 5,000 acres of bog marsh, on which they have expended $60,000 in cutting a canal about seven miles long through the centre of the marsh, draining off the fresh water and allowing the salt water and mud to kill the vegetable matter. This has proven a great success and will be a wonderful source of revenue to the province in which it lies. He is also a director of the Maritime Heating Company, who employ a large number of men, make the Robb heater, and carry on a machine business. He is a large owner in the New Brunswick Petroleum Company, for which there is a good outlook. The company have bored forty wells, all of which are giving splendid results. The oil is of the best quality and the company is now arranging to build a refinery.

As one of the Governors of Acadia University at Wolfville, N.S., Mr. Rhodes takes an active interest in the progress of that institution. He believes in a young man aiming high, and that with honesty and hard work the highest aims can be attained.

The popularity of Mr. Rhodes as a citizen was evidenced by his recent election as Mayor of Amherst, the first public office which he ever sought.

KILN-DRYING HARDWOODS.

Concerning the drying of hardwoods a writer in The Wood-Worker says:

As for the question of air-seasoning lumber before it is kiln-dried, that is a matter of opinion, and depends largely on whether you can carry a sufficient stock to allow of it. I do not consider it a necessity, as lumber can be dried as well green, if done properly, and without checking, but under ordinary conditions and with the appliances generally in use, a few months outdoor seasoning is beneficial; but this depends largely upon the season of the year the stock is piled, as lumber will season much faster during the spring and fall months than in the summer, owing to the wind, which draws the moisture from the pores of the wood and leaves them open, not shrinking the stock as much as does the heat. Of course, this air-drying helps the lumber when placed in the

FOR THE CAMP

We have a very suitable lot of goods for camp supplies. We make this kind of trade a specialty. You who are not getting suited just as well as you would like, try us for your next order, and give us a chance to demonstrate our ability to give you satisfaction in this very important department of your business.

H. P. ECKARDT & CO.

Wholesale Grocers TORONTO

kiln, as the sap and much of the water is gone from the wood and the heat doesn't contract the cells or pores quite so much.

The great trouble with hardwood lumber in drying is the tendency to honeycomb, which is due largely to the contraction of the pores on the surface before the moisture is released from the center. This is accomplished in air-drying because there is no extreme heat to close the pores, which remain in their natural state. You will readily see that if we keep the pores of the wood open until the moisture is drawn from the center, we avoid honeycomb or checking. The greener the stock the more apt it is to check. Oak is probably the worst of all hardwoods to honeycomb, owing to the coarseness of the grain and consequent amount of sap and water it contains. Maple is more apt to have what we call blind checks.

One thing that I think is not properly considered is proper sticking of hardwood. The sticks should be narrow and project slightly over the ends of the lumber, each length pile separately and not too tight, keeping the sticks directly over each other. Then each piled should be well covered from the weather, pitch enough being given to the pile to shed rain easily. Lumber stuck this way rarely checks far at the ends and will come out bright in color, which is the main feature in fine finish.

Lumber air-dried fairly well should not take over five or six days to thoroughly dry, if heat is kept on continuously (which is preferable). Hardwood can be dried in less time, but I should not advise it under the ordinary conditions, as it requires close watching and better facilities than most plants are equipped with. There are few men who make first class lumber pilers, and that accounts for a great deal of crooked lumber. Great care should be taken to pile it straight, not too tightly, using as narrow sticks as possible. Lumber properly stuck will dry with much less danger of checks or honeycomb.

As for the method of drying, there are many that are good, and the time varies according to treatment. I have dried perfectly green stock in six days, but had specially arranged equipment for it. I will take the most ordinary method at present and give some points for consideration. I think the ordinary blast-kiln very satisfactory under ordinary conditions. I would advise a long kiln, cars to be loaded at one end and unloaded dry at the other. By making the kiln long enough for eight or ten cars of about 2,000 feet of lumber each, you can take out one or two cars daily, if partly seasoned before putting in the kiln. One advantage of such a kiln is that the lumber is moved forward to the higher degree of heat gradually. In filling the kiln I should fill only two or three cars the first day, allowing only about 100 degrees heat at first, then fill a couple of cars each day, letting the others down until the kiln was full, then increase the heat from 130 to 140 degrees.

When the kiln is full the air is partly laden with moisture before it reaches the fresh stock, and does not check it so badly. If there is still a tendency to check the lumber, I should have steam pipes put in, with a valve opening in front of the hot-air inlet, by which I could let on live steam to moisten the air as it comes into the kiln. This keeps the outside pores open until the stock is dry. If you were to try this where you have been troubled with checks and honeycomb you would be surprised at the beneficial results, as the lumber is not case hardened, but soft and more easily worked. It does not require much steam. If lumber can be given a good steam bath before turning on heat it hastens the drying. Of course, the thicker lumber requires a longer time to dry. I have taken twenty days to dry 4-inch hard maple, but it came out in first-class shape, free of checks and as wide as 16 inches.

DOUBLE CYLINDER "LIGHTNING" FLOORER.

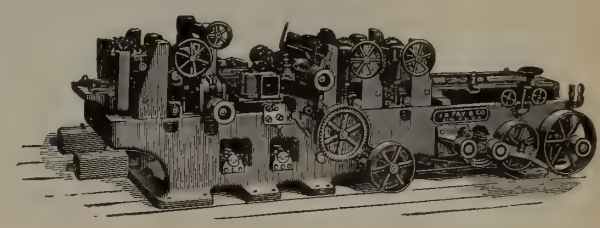
We take pleasure in showing our readers an improved flooring machine and we know all those who have this class of work to do will be interested in its merits. It was patented March 20th, 1900, and is built especially for those who make flooring, ceiling, siding, casing and other work of that character in large quantities. Attention is directed to some of its important points claimed by the manufacturers :

1. It works 4 sides, 9 or 14 inches wide, 6 inches thick, and by the use of belt-tightening apparatus, 1½ inch stock can be matched to advantage. This last device is a decided improvement on this machine and one easily appreciated by all lumbermen. The frame is massive, prevents vibration, and resists all strain, and the machine can be run at a very high rate of speed, under instant control of operator.

2. The feed is six large powerfully-driven rolls, with expansion gearing, that can be easily raised and lowered, and the feeding-out one is provided with scrapers.

3. The matching works are very heavy, and cylinders four sided and slotted, and chip breaking lips are provided to work cross-grained or knotty lumber. Shaving hoods swing outward to give access to knives. Pressure bars have easy adjustments to insure easy operation.

Taken altogether, this machine will be found to possess many new advantages, and is in fact one of



No. 15 "Lightning" Floorer.

the most successful specialties of the makers. Testimonial letters from users testify to its merit, and copies of them can always be had on application.

Further details can be had from the builders, J. A. Fay & Egan Company, of Cincinnati, Ohio, who will also send free to those who will write for it, mentioning this paper, their new illustrated catalogue of woodworking machinery.

J. Fyfe Smith is endeavoring to induce the City Council of Vancouver, B. C., to use Australian woods for bridges and similar purposes. He offers to supply tallow wood for $49.50 per thousand feet and guarantees the wood for 30 years. The engineer reported that the B. C. fir cost $20 and lasted only three years. It has been decided to use the Australian timber in the Westminster avenue bridge as an experiment.

WOOD PULP DEPARTMENT

QUEBEC PULP WOOD ASSOCIATION.

The annual meeting of the Province of Quebec Pulp Wood Association was held at Sherbrooke on April 8th, when the following officers and directors were elected: President, H. M. Price, Quebec; E. W. Tobin, M.P., Brompton Falls; M. N. McCrea, Sherbrooke; O. C. Morrissette, Lake Megantic; G. H. St. Pierre, M.P.P., Coaticook; O. Brouillard, Carmel; G. C. Poulin, St. Johns; G. T. Smith, Montreal; B. C. Howard, Sherbrooke; G. P. Nadeau, Stanfold; John Campoux, D'Israeli.

It was decided to hold an association dinner at Sherbrooke on May 31st next.

NEW PULP MILL COMPLETED.

We learn that the erection of the new pulp mill by the Chicoutimi Pulp Mill Company, Limited, at Grand Mere, Que., is now completed. This work has been in hand for nearly two years. It is probably one of the finest pulp mills in Canada, and has been built with a view of utilizing all modern improvements for convenience and utility. In addition to the mill itself, the company are providing an estate of forty houses, a church and parochial offices, and everything needful for their employees and the establishing of a trading village.

The architect who had the carrying out of this extensive establishment is Mr. R. P. Lemay, of St. John Street, Quebec.

NEW SUPPLY OF PAPER.

It is announced that peat has been found to make an excellent quality of paper. A large mill was established a few months ago at Celbridge, County Kildare, Ireland, which has been engaged in converting Irish peat into wrapping paper of various grades. The mill site is on the River Liffey about twenty-five miles from Dublin, near the eastern margin of the great bog of Allen which extends westward about seventy miles to the River Shannon.

The process of converting the peat into paper is a wonderful metamorphosis. Carts are engaged hauling the raw peat from the bog, where it is dug direct to the mill. Then begin the various processes of cooking with the necessary chemicals until it becomes reduced to the condition of pulp required, after which the methods followed are very similar to those of the ordinary paper mill. It is somewhat of a singular sight to see the black peat fresh from the bog thrown into the mill at one end and follow it to the other end where it emerges as paper. It is claimed for the new industry, this latest discovery, that it will prove an opulent mine of wealth among the Irish people. Certainly the raw material is at hand in great abundance in the ample boglands of the island.

THE PULP INDUSTRY IN ONTARIO.

The annual report of the Crown Lands Department of Ontario contains the following reference to the wood pulp industry:

The Sault Ste Marie Pulp & Paper Company took out considerable quantities of pulp wood last winter, but owing to the unfortunate financial condition into which the affairs of this company have fallen, the pulp mills as well as the other industries were shut down for a considerable period. The Receiver has been operating the pulp mills since the beginning of November, and using up the wood taken out by the company last winter.

The Sturgeon Falls Pulp Company has completed its new mills, and carried out to the full its contract with the Government, and has now in operation an extensive plant, capable of turning out from 40 to 50 tons of newspaper per diem. This company is taking out during the present winter a large supply of pulp wood.

The Spanish River Pulp and Paper Company has the construction of its plant sufficiently well advanced to warrant it in taking out a supply of pulp wood during the present winter.

The Nepigon Pulp & Paper Company proposes to proceed with the erection of its mills on the opening of navigation.

The Rainy River Pulp Company has had plans prepared, and is about to construct its dam at Sand Island Falls, on the Seine River, where it proposes to develop some 10,000 horse power.

The Montreal Pulp and Paper Company has not yet proceeded with active development.

The territory covered by the Blanche River pulp concession having been almost entirely settled up, the benefit of the pulp wood upon the lands will inure to the settlers instead of to the Crown. This company, however, has not yet erected its mills.

THE DEVELOPMENT OF THE PULP AND PAPER INDUSTRY.

The Quebec Colonization Commission has reported at some length upon the various measures that have been proposed to stimulate the development of the pulp and paper industry, and in conclusion says: "There remains, therefore, as a practical means of stimulating the development of the industry, only the payment of an export bounty on paper manufactured in the country. Such a means of encouraging our native industry entails no drawbacks. It is acknowledged as the most effective and its effect would be immediate."

Concerning the imposition by the Quebec Government of a stumpage sur-tax on the pulp wood cut on Crown lands and exported to the United States, the Commission argue as follows:

In addition to the other drawbacks it entails, the imposition of a stumpage sur-tax by the provincial authorities would effect only far too small a proportion of the timber exported to yield results of any importance. The following facts seem to place this beyond a doubt:

From the information supplied us by the Department of Customs it appears that there were exported from Canada to the United States 379,338 cords of pulp wood, whereof 322,395 cords or 84.95 per cent. came from the Province of Quebec. The report of the Crown Lands Department of Quebec shows that, in fact, 202,633 cords of pulp-wood were cut on Crown lands in 1903, whereof only 51,962 cords were exported. Deduct this quantity from the total exported, say 322,393 cords, and there remain 270,433 cords which were evidently cut in the seigniories and on patented lands.

This clearly shows that the stumpage sur-tax imposed by the Quebec Government can affect only a very small portion, one-sixth at the most, of the pulp wood we export to the United States. Moreover, such sur-tax has the drawback of putting the settler who establishes himself on a Crown lands lot in an exceedingly disadvantageous position as compared with him who settles on a lot in a seigniory. If pulp wood sells at $4 the settler in a seigniory gets $4 net for himself, while the settler on a Crown lot who gets $4 for his wood is compelled to deduct from such the stumpage payable to the Crown, 65 cents, which leaves him only $3.35 net.

In reason and in equity a government should not be guilty of such injustice towards settlers who undertake to settle on its lands.

The imposition by the Federal Government of an export duty on pulp wood, say the Commission, would be a more effective means of attaining the desired end. The question is to know whether it would be prudent or equitable to adopt it. To be effective, this export duty should be high enough to counterbalance the difference between the cost of transporting the pulp and pulp-wood and the import duty imposed on pulp in the United States.

Between Ottawa and certain points in the United States, notably Buffalo and Shortsville, the cost of shipping pulpwood and pulp is $2.60 per ton for the wood, and $3 per ton for the pulp. It takes a cord of wood to make a ton of pulp, dry weight. But ground or mechanical pulp holds 50 per cent. of water, so that to ship a ton of this pulp to the United States, transportation must be paid on two tons of freight—on the pulp itself and on the water which it contains—which brings up the real cost of transportation to $6 a ton on the dry weight. Pulpwood only pays $2.60 a ton, which makes a difference of $3.40 per ton against our pulp-makers. Pulpwood pays no import duty in the United States, but pulp pays one of two dollars and upwards per ton, which increases to $5.40, the disadvantage under which our pulpmakers labor in placing the product of their mills on the American markets. To overcome this disadvantage and place our Canadian manufacturers on an equal footing with the United States, it appears to us clear that we must give them the benefit of an export duty of at least $5 or $6 a cord on pulpwood.

In the long run, or rather at the end of a few years, the imposition of this export duty on timber would certainly produce the desired result, and would give a marvellous impetus to the pulp and paper industry; but the adoption of this measure would have the immediate effect of ruining by far the greater number of the pulp mills now in operation in the province. This is the opinion of Mr. J. A. Dubuc, manager of the Chicoutimi Pulp Company, and undeniably one of the most competent men to express a pertinent and practical opinion on this question.

HOO-HOO AT CHATHAM.

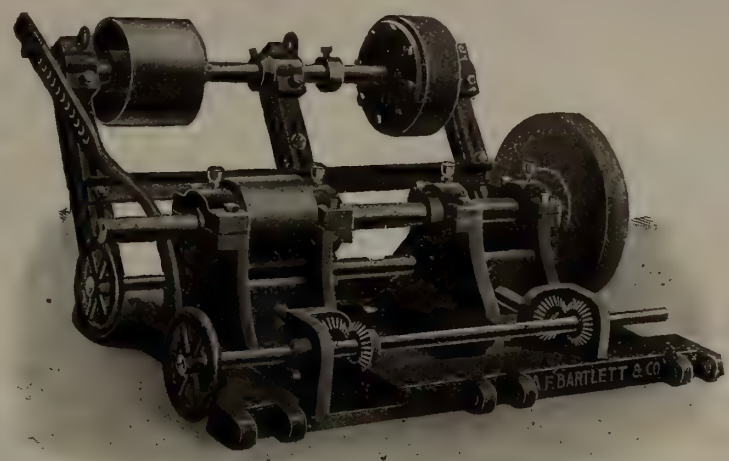
The Concatenation held at the city of Chatham, Ontario, on April 29th was a grand success, and the five and forty lumber dealers who participated therein will long cherish the memory of that gathering. A class of nineteen presented themselves for instruction, and their names have been added to the growing roll of Ontario Hoo-Hoo. That the arrangements for the entertainment of the visitors were in the hands of Messrs. Chas. and Will Hadley was a guarantee that there would be nothing lacking. Chatham's hospitality is famous ; the Hadleys have made it so. The visitors had looked forward to a good time, but the realization outdid their fondest dreams, and words failed to express their gratitude to the lumbermen and citizens of Chatham for the hearty welcome and entertainment.

One feature that was much enjoyed was an automobile procession over some miles of the broad, well-paved streets of the city, with its many fine buildings and beautiful homes. Mine host McCoig, of the Garner House, was most attentive to the comfort of his guests. The Concatenation was held in Auditorium Hall, and at its conclusion all adjourned to the Garner House, where an elaborate banquet was enjoyed.

The menu cards were in the form of a black cat couchant with tail pendant and graced with a poem of welcome prepared for the occasion by the Hoo-Hoo Poet. Song, oratory and story so beguiled the fleeting hours that the evening seemed all too short. It is proposed to hold another concatenation shortly in Orillia.

BAND WHEEL GRINDER.

We herewith present an illustration of the Marshall patent band wheel grinder which A. F. Bartlett & Company, of Saginaw, Mich., are placing on the market. This is a machine which should be in every band mill. It is simple, easy to operate, heavy enough for strength, and light enough to be easily handled. Keeping the band wheels ground true lengthens the life of the saw, and does better work. With a band wheel grinder always in the mill, there is less likelihood of this duty being neglected. One of the best things about this machine is the fact that the manufacturers claim that it will pay for itself in three times using.



BAND WHEEL GRINDER.

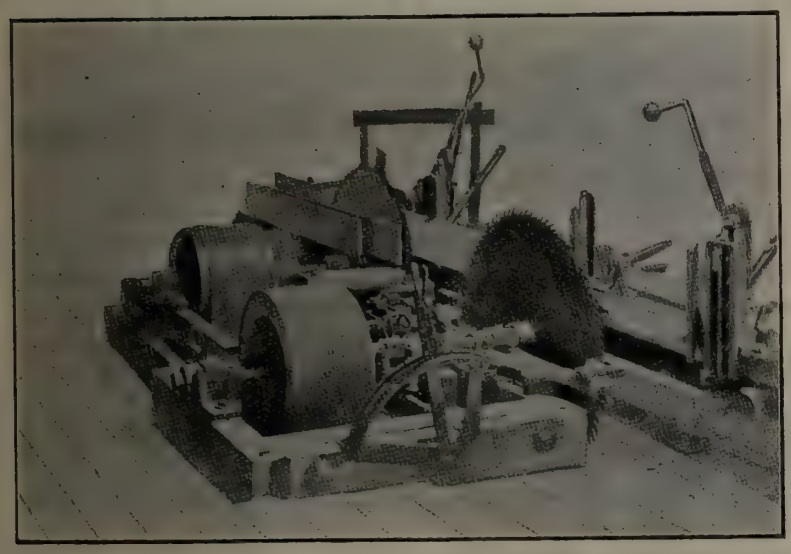
NOTES.

It is reported that the St. George Pulp & Paper Company, of St. George, N. B., will build a paper mill.

It is understood that Thomas Allison has been appointed manager of the Spanish River Pulp & Paper Company at Webbwood, Ont.

The Royal Pulp & Paper Company, of East Angus, Que., will this month install new machinery for increasing the capacity of their paper mill.

The new pulp mill of J. R. Booth at Ottawa will probably commence operations this month, and will likely run day and night, with 70 men. It is said that Mr. Booth is considering the building of a paper mill.



"KILLAM'S TANDEM CIRCULAR SAW MILL"

The attention of Manufacturers of Lumber is called to the above named latest and best method of sawing lumber.

The following advantages are obtained:

Lower cost of installation than any other method which will saw an equal number of superficial feet in a given length of time.

Smaller expense in operation, thus producing lumber at a lower cost per thousand feet than any other method.

Requires no more help to operate it than any well equipped Circular Saw Mill.

Lumber has been sawn better and more accurately cut by this method than by any other now in use.

The Killam Tandem Circular Mill requires no more skilled men to operate it than is required to operate the ordinary Circular Mill.

If solid saws are used, the larger one, when worn down can be used for the smaller one, thus saving expense for saws.

No difficulties in handling or setting by this machine and no delays.

No time is lost in setting for any thickness from the cut of stationary saw up to six inches.

This machine takes the place of a resaw in a mill and only requires a floor space of 6 ft. x 6 ft.

Also takes the place of a Twin Circular Mill that is now used for slabbing, and this machine will side as much lumber as any Twin Circular, thus saving the expense of a resaw and men to operate the same.

This machine is so cheap that any manufacturer of lumber can well afford to have one, for it will pay for itself in a short time.

Will cut 50 per cent. more lumber than the Circular Mills now in use.

MANUFACTURED BY OXFORD FOUNDRY & MACHINE COMPANY, OXFORD, N. S.

REFERENCE.

M. L. KILLAM, TRURO, N. S.

Dear Sir,—It gives us great pleasure to testify to the value of your Tandem Circular Saw Mill. It has paid for itself twice over during the six months we have run it. It requires no more help to operate it and the lumber is more evenly sawn. It does all that you claim it will and we would recommend it to any manufacturer who wishes to make more and better lumber with the same help as with the SingleCircular Mill. Wishing you success, we are Yours very truly,

Dec. 31, 1903. DICKIE & McGRATH, Tusket, N. S.

PROFITS FROM FORESTRY.

In the Black Forest of Germany is the little city of Freudenstadt, with about 7000 inhabitants, a busy industrial place, with iron and chemical works of some importance. Small as it is, Freudenstadt is a full-fledged city, with a mayor, half a dozen policemen and a fire engine. The public business is conducted on an econimical basis, and the total expenses do not exceed $25,000 a year.

Freudenstadt has the distinction of being the only city in Germany, and perhaps in the world, which does not tax the citizens a dollar for municipal expenses. The yearly net revenue from the public property covers all the outgo. This property consists of about 6,000 acres of fine forest, which, being managed under the best forestry methods, is a permanent source of income. One or more trees are planted for every one that is cut down. No tree is cut till it can yield the maximum profit. After deducting all the expenses of the industry the annual profit to the acre is about $5. This is exceptional, even for Germany, where the annual profit ranges from $3 to $4.50.

The question is often asked in this country whether it will pay to keep land under permanent forest. Unless at least a moderate profit is possible no one can be expected to grow trees on land that can be used for any other purpose.

The Rhode Island Experiment Station is now giving some attention to this question, and in a bulletin just prepared by Prof. F. W. Card some interesting figures are presented. He cites the experience of Zachariah Allen, of Rhode Island, who planted a worn pasture with trees in 1820 and kept a careful financial record till 1877—57 years. After deducting all expenses he found that his profit was nearly 7 per cent. per annum on the original investment.

There is also a record of the returns on a 40-acre tract of white pine in New Hampshire for 80 years, during which time the average annual profit was $3.75 an acre. The facts given by Professor Card seen to show that only a moderate profit is to be expected from forests treated as a permanent crop. Perhaps we cannot make as much money in this industry as is made in Europe, where every part of a tree can be marketed at some price, even the small branches and twigs being gathered into bundles and sold for firewood.

George White has just completed a new planing mill at Parry Sound, Ont., equipped with modern machinery.

THREE RIVERS, QUEBEC

Established 1860

RIVER STEAMBOATS.

An opportunity is afforded those who contemplate the building of river steamboats through the offer made by Marine Iron Works, Station A, Chicago, U.S.A., to make up and furnish without charge, complete working plans and specifications, together with small half model of the hull made to scale, provided only that the order for the outfit of driving machinery is first placed with them, thereby permitting a correct design as to draft, power, strength, carrying capacity, etc., through the intimate knowledge which they have of the subject and of the power that is to drive the vessel. The Marine Iron Works have just issued a pamphlet entitled "River Navigation" that will be sent free on request to persons mentioning THE CANADA LUMBERMAN.

PRIZES FOR TREE PLANTING.

In connection with the work of the Forestry Branch of the Department of the Interior, Mr. J. H. Haslam, of the Haslam Land and Investment Company, proposes giving prizes aggregating one thousand dollars, to be awarded to those who have most successfully gone into tree plantation during the present year.

The Forestry Eranch are sending out two million trees and to those who obtain the most successful results in the fall of 1906 will be awarded prizes for forest plantations, wind-breaks, and hedges. The prizes to go to farmers in Assiniboia, N.W.T. The conditions are: The forest plantations must not be less than an acre; wind-breaks must not be less than 10 feet wide; and hedges must be trimmed with no blank spaces, and all must be in good cultivation, with the trees thrifty.

The planing mill of Paul Lea, Moncton, N.B., was recently damaged by fire.

OVER 1475 CIRCULAR FILERS

now using my gauges and instructions. I give the short infallible method. Failure is out of the question. Your first saw a perfect saw. Sent prepaid on trial to honest men. Fit your saw to my gauge and if it don't run perfectly I will pay freight both ways and hammer it free.

Send for Canada references.

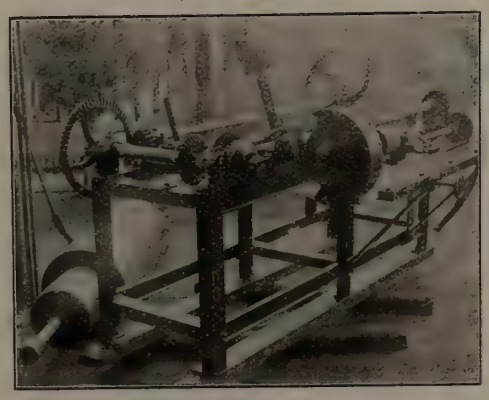
Saw Grinders



The Kennedy Island Mill Co., Ltd., Riviere du Loup, Que., says—

"I might say to you that this Grinder is all right and has paid for itself twice over since I bought it. No Shingle Mill of any account should be without one."

TRIMMERS

If the Board does not reach the quadrant the Saw stays down and trims, see cut. To cut off more than two feet, bad ends, etc., pull the cord, see dotted lines. The whole Board can be cut into two foot lengths or trimmed in any manner. The Saw frame is balanced, the Arbor pulleys are 8 in. x 8 in. We build several styles of Trimmers, also all kinds of

Saw and Shingle Mill Machinery

Our "Boss" Shingle Machine is second to none in Canada. Our sales will prove it. We make Saw Jointers and Knife Jointers, also Packing Boxes. Send for Catalogue.

B. R. Mowry & Sons, GRAVENHURST, ONTARIO

FORESTS OF HARDWOOD.

A resident of Bancroft, Ont., writes to the Toronto Globe as follows :

The question of whether the city man in the country or the country man in the city is the greener has been suggested as a subject for debating societies. A few days ago I saw it stated in the report of the proceedings of the Provincial Parliament that a prominent member of the Opposition had expressed surprise at the statement made by the Commissioner of Crown Lands that there were large areas of hardwood land that are valueless for agricultural purposes. In the northern part of the county of Hastings and in the provisional county of Haliburton, and more or less from the Georgian Bay nearly to Perth, a very large percentage of the land is densely covered with hardwood—where it has not been burned up—and it is safe to say that three-fourths of this land could never be ploughed on account of rock and stone. In some parts the soil is of fairly good quality, but boulders and projecting rocks render it practically valueless. When first cleared such land often produces excellent crops, and if it is seeded down with clover and timothy about the second crop, good crops of hay may be cut for several years, but the grass runs out and is replaced by the oxeye daisy or other weeds, and it is impossible to plough, so the land becomes practically worthless.

I should not perhaps have made any remark on the Opposition member's break if I had not seen it stated in The Globe that the season for forest fires was from May till October. This is true enough, but in case of an early spring with little or no rain the last two weeks of April is probably the most dangerous season of the year for forest fires. The sun is very hot and the winds are high, and there is no green growth, either of leaves or grasses or herbs of any kind. The dry leaves lie thick on the ground, and every rotten log or branch is ready to break into a flame the moment a spark touches it.

I have frequently heard of cases where fire was carried more than a mile across lakes and green swamps during the month of April, and by far the most destructive fire we ever had in this district was in April of last year. Speaking from the experience of a third of a century in the back country I may say that the policy of appointing fire rangers is a good one, but they should in most years begin their work about the middle of April. In some years they might be called in in the early part of October, but in dry falls the danger after the leaves have fallen is almost as great as at any time in the year.

TRADE NOTES.

Emerson Smith & Company, Beaver Falls, Pa., are sending out copies of the 1904 edition of their saw hand book and price list. A copy of this book will be mailed to any of our readers who may write for same, mentioning the CANADA LUMBERMAN.

The A. J. Burton Saw Company, which has recently been organized at Vancouver, B. C., with a capital of $75,000, have purchased the site for their works and commenced building operations. They expect to be in a position to execute orders about midsummer.

The attention of our readers is directed to the advertisement of the Garlock Packing Company, of Hamilton, Ont., appearing on page opposite first reading page of this issue. This company do a large trade in the line of mill supplies, such as belting, packing, etc., and will be pleased to send particulars of their goods to any reader who may write for same mentioning their advertisement in the LUMBERMAN.

The Dodge Manufacturing Company, of Toronto, Limited, who in January last opened up a branch office and distributing ware rooms at 419 St. James Street, Montreal, report very gratifying results from that quarter. The Montreal office is in charge of Mr. Frank F. Young, formerly of the sales department at head office. Mr. Young says a large percentage of the mills and factories seem to prefer taking their requirements from the maker when it is made convenient for them to do so, and as Montreal is the recognized distributing centre for the eastern part of the province, he finds a ready welcome from all quarters for Dodge products.

Mr. G. H. Mosher, patent attorney, of Truro, N. S., has just taken out a patent on behalf of Mr. M. L. Killam, of the same place, for an auxiliary saw guide. He has also applied for a patent for self-adjusting sett collars to be placed on saw arbors, by the use of which saw-mill owners will be enabled to operate much thinner saws than have heretofore been used in circular saw mills. The Grand River Pulp & Lumber Company, of which Mr. John A. Gillis is manager, are erecting a large mill in Labrador in which they are installing all of Killam's latest improvements, including tandem circular saw-mill, auxiliary saw guide and self-adjusting sett collars.

The dissolution is announced of R. Jellyman & Company, box manufacturers, Montreal.

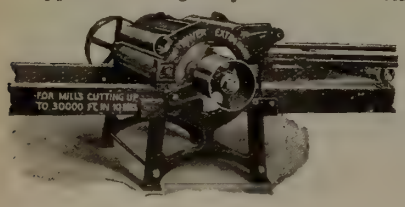
THE GORDON HOLLOW BLAST GRATE CO.
GREENVILLE, MICHIGAN

The Largest Manufacturer of

HOLLOW BLAST GRATES
EDGERS AND TRIMMERS
IN THE WORLD.

The Gordon Hollow Blast Grate makes two boilers do the work of three. Sold on approval after 30 days' exhaustive trial.



The TOWER 2 and 3-Saw Edgers, Improved. For mills cutting not to exceed 20,000 feet in 10 hours.

The TOWER EXTRA 3-Saw Edger. A larger and heavier edition of the TOWER, for mills cutting up to 30,000 feet.

These Edgers are pre-eminently simple and practical. They contain everything that is essential and nothing that is superfluous. This enables us to offer them at extremely low prices.

Our claims for them are best substantiated by the fact that there are over 1300 of them in daily use.

The TOWER One-man 2-saw Trimmer.

This is distinctly a one-man trimmer, enabling one man to easily trim the output of a mill cutting up to 30,000 ft. in 10 hours.

It does more work in a given time than any other 2-saw trimmer made, and that with less fatigue to the operator. The reason is that it simplifies and combines the necessary operations.

"The Best in the Land"

Comes only to the man who gets the "best in the land" to help him. Whether its men—whether its material—or whether its machinery. Its a hard road to the millionaire's bill of fare to try to get shingle profits with an old style, out-of-date machine. There's only one sure way. That is to use

The Columbia Shingle Machine

Absolutely the fastest cutting, easiest operated, safest and strongest machine for producing shingles now on the market. The only machine with point regulation—the only one with standard butt and standard point—the only one on which you can make 1,000 additional shingles from every 1,000 feet of logs. Write for catalogue and testimony of what others think of this unrivaled shingle machine.

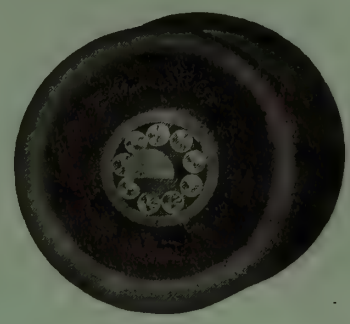
NATURAL DRAFT MOIST AIR .. DRY KILNS

LUMBER TRUCKS and TRANSFER CARS

Write for prices and particulars of the most simple and efficient Natural Draft Dryer on the market. Testimonials and list of users sent on application. Every square inch of heating surface is utilized to the uttermost and perfect ventilation and circulation is obtained by a very simple arrangement of ducts. Write for particulars to

SHELDON & SHELDON,
GALT, ONT.
FORMERLY McEACHREN HEATING & VENTILATING CO.



NO—the ordinary dry kiln truck doesn't cost as much as the THE STANDARD Channel Steel, Roller Bearing DRY KILN TRUCK does.

No. You see, the ordinary truck hasn't got the unbreakable MALLEABLE iron Wheels.

It hasn't got the SHARP-POINTED "anti-friction" steel roller bearings, either.

We have some printed things on the subject that you might like to read. A request for Catalogue "D" will fetch them.

THE STANDARD DRY KILN CO.
Indianapolis, Ind.

Do You Need a Turbine?

Now is the best possible time for replacing your old, worn-out wheel with a new Turbine that will save Worry, save Time, and make Money for you. If you want a well built wheel, a wheel that will give you steady reliable power every day, a wheel that will save water, a wheel that will last you a lifetime, and that is sold at a reasonable price, then write us for catalogue and prices on the

Standard Leffel and Vulcan Turbines.

They are better developers to-day than ever before, and are growing in popularity, as our order books show.

We have now for distribution our new **SAW** and **SHINGLE MILL MACHINERY CATALOGUES,** with engravings and descriptions of our machines with their latest improvements. We will be glad to send you one on receipt of your address. You cannot buy a better Portable Mill than the "Lane Improved".

Builders of a Complete Line of

SAW MILL MACHINERY

We show herewith Our No. 1 Iron Frame Gang, a machine which is probably giving better satisfaction than any other gang on the market.

It is very extensively used —the largest mills in Canada have it, from the Atlantic to the Pacific Coast.

It has one of the most improved styles of oscillating motion in use.

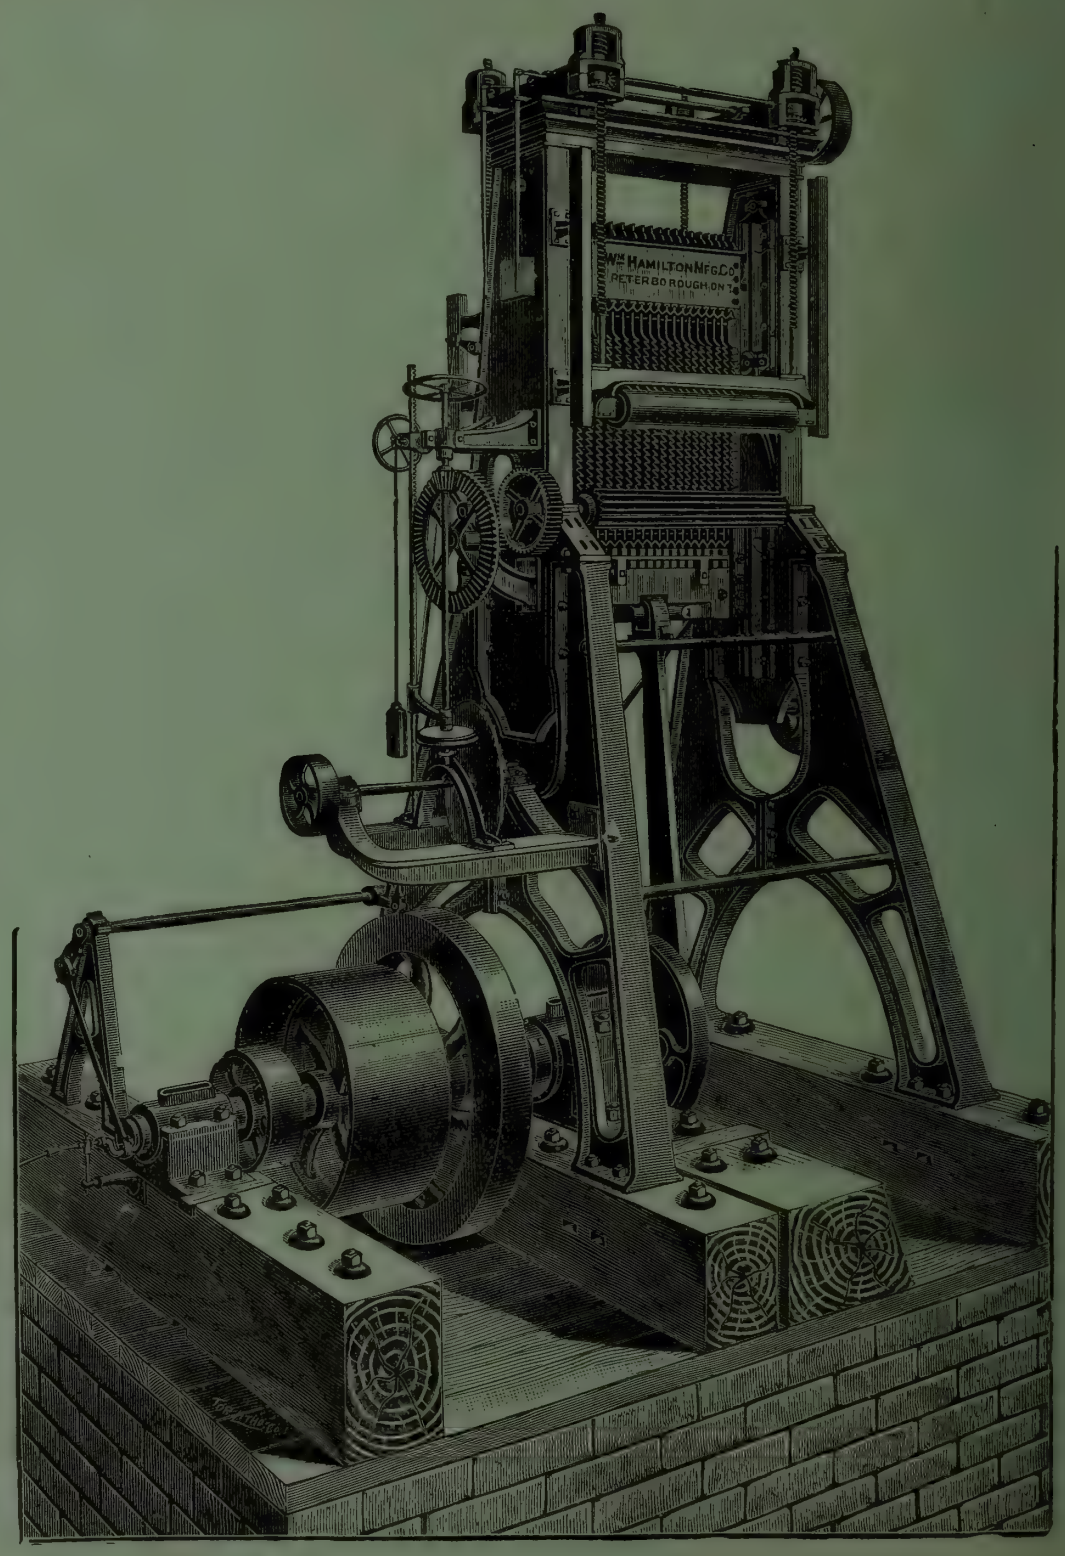
The press rolls are operated by power, and it possesses all the good features of the best American gangs, with heavier frame work and heavier shaft, with the result that it works rapidly, steadily and correctly.

For uneven cants we can furnish a Divided Binding Roll.

One of these machines with 54 inch sash has a capacity of 100,000 feet of one-inch lumber per day of eleven hours.

We would like to have an inquiry from you as to its many merits.

When you write do not forget that we manufacture everything for a saw mill.



Head Office and Works:

Branch Office: Vancouver, B. C. -- **PETERBOROUGH, ONT.**

R. H. SMITH CO., LIMITED

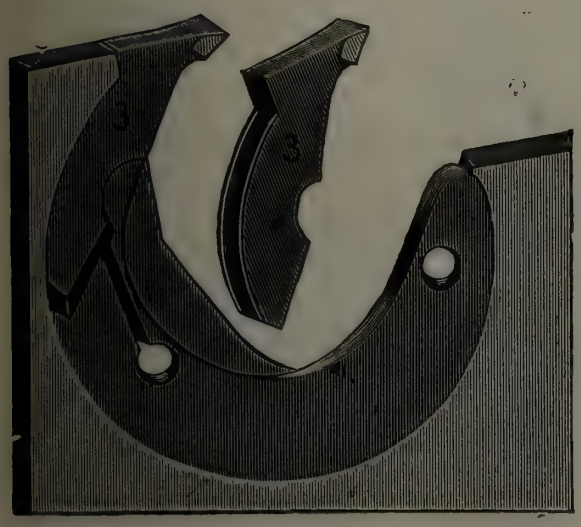
St. Catharines, Ont.

We are the Sole Manufacturers of Saws under the

Simond's Process

in the Dominion of Canada.

There is no process its equal for tempering circular saws. Other makers recognize this fact, as some of them, in order to sell their goods, claim to have the same process. **All such Claims are FALSE,** as the patentee in the U. S. and ourselves are the only firms in the world who use it.



INSERTED TOOTH SAWS

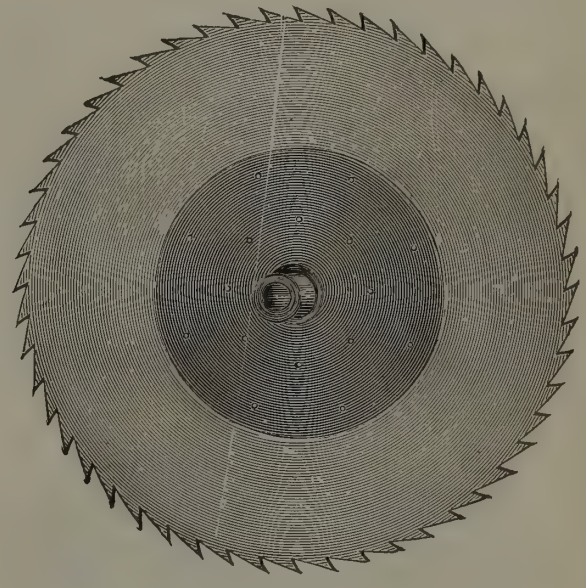
Notice the improved shank. We call particular attention to the swell which strengthens it at the weakest part and which gives it more wear than the old style.

Shanks made in usual gauges and to fit your saws perfectly.

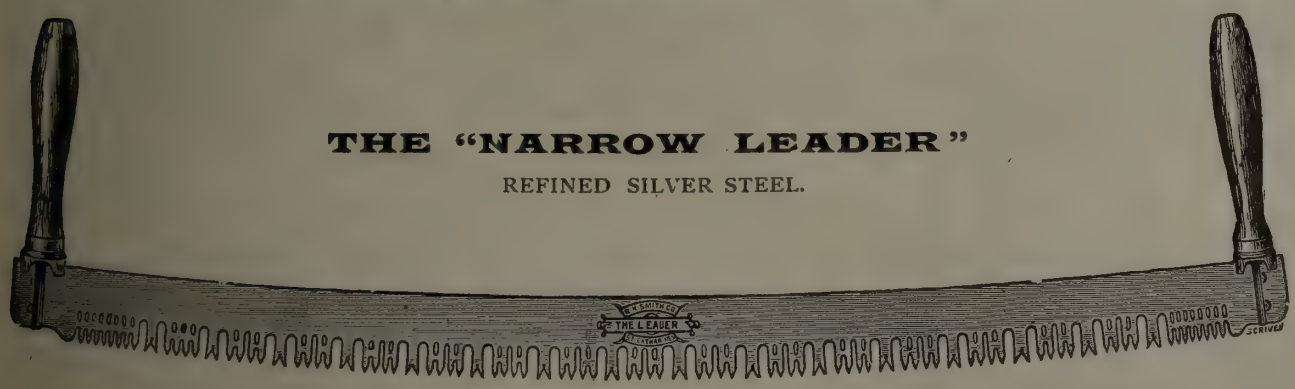
SHINGLE SAWS

The quality of the "Simonds" Shingle Saws is proven by the fact that the largest shingle and machine manufacturers in Canada are using them.

Run a "Simonds" and you will increase your output.



CROSS-CUT SAWS



The Simond's temper and style of tooth make the "Leader" the fastest and easiest cutting saw manufactured.

Write for prices.

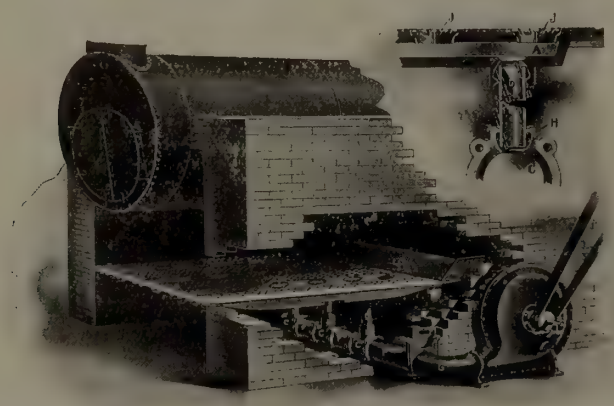
DO YOU LACK STEAM? WE CAN HELP YOU.

The Gordon Hollow Blast Grate



What does the Gordon Hollow Blast Grate do?
The Gordon Hollow Blast Grate promotes combustion by fanning the boiler fire, in the same manner as the blacksmith's bellows.

How much does the Gordon Hollow Blast Grate add to the efficiency of a boiler?
From 20 to 50%.

Will the Gordon Hollow Blast Grate burn sawdust satisfactorily?
Yes, it gives as good results with wet, green or frozen sawdust as a draft grate gives with dry wood.

Is the Gordon Hollow Blast Grate only an experiment, or is it a demonstrated success?
It is very far indeed from being an experiment. It has been on the market for over fifteen years, and there are more than 2500 sets in daily use.

What guaranty has the purchaser that the grate will do what is claimed for it?
The Gordon Hollow Blast Grate is sold on approval, 30 days being given in which to thoroughly test it. If unsatisfactory, it may be returned at the manufacturer's expense.

What information must be given to secure a quotation?
Give number of boilers, width of furnaces or ovens and length of grates.

Where is this grate manufactured?
It is manufactnred by

The Gordon Hollow Blast Grate Co., Greenville, Mich.

ESTABLISHED 1889.
The largest manufacturer of Blast Grates, Edgers and Trimmers in the world.

A RARE OPPORTUNITY

The undersigned is prepared to receive sealed tenders up to THE 30TH DAY OF JUNE, 1904, for the buildings, machinery, stock, etc., of the Alexandria Wood Export Company, Limited. The buildings are practically new and the machinery of the most modern type. The property can be easily changed from its original purpose to a furniture or waggon factory. It is situated in one of the most central and thriving towns in Ontario. As an evidence of the business done in the town, one of its factories has an output of about five thousand carriages annually.

The highest or any tender not necessarily accepted.

ANGUS McDONALD, Assignee.
Alexandria, May 14, 1904.

Province of Quebec.

Department of Lands, Mines and Fisheries.

Woods and Forests.

Quebec, 21st May, 1904.

Notice is hereby given that, conformably to sections 1334, 1335 and 1336 of the consolidated statutes of the Province of Quebec, the timber limits hereinafter mentioned, at their estimated area, more or less, and in their present state, will be offered for sale at public auction, in the Department of Lands, Mines and Fisheries, in this city, on WEDNESDAY, 22ND DAY OF JUNE next, at TEN o'clock A.M.

CONDITIONS OF SALE.

No limit will be adjudged at less than the minimum price fixed by the department.

The limits will be adjudged to the highest bidder on payment of the purchase price, in cash or by cheque accepted by a duly incorporated bank. Failing payment, they will be immediately re-offered for sale.

The annual ground rent of three dollars per mile, with fire tax, is also payable immediately.

Those timber limits, when adjudged, will be subject to the provisions of all timber regulations now in force or which may be enacted hereafter.

Plans of limits offered for sale are opened for inspection in the Department of Lands, Mines and Fisheries, in this city, and at the office of the Crown lands and timber agents in the different agencies in which said limits are situated, up to the day of sale.

N. B.—No account for publication of this notice will be recognized, if such publication has not been expressly authorized by the department.

S. N. PARENT,
Minister of Lands,
Mines and Fisheries.

OUR WINNIPEG OFFICE.

The publishers of this Journal have recently opened a branch office at No. 310 McIntyre Block, Winnipeg. A resident representative has been appointed who will be exclusively employed in advancing the circulation of this Journal and in keeping our readers informed regarding the latest developments throughout the west. The kind co-operation of our friends in the west is solicited in behalf of the success of this enterprise.

CURRENT TRADE CONDITIONS.

ONTARIO.

Under the influence of a moderate demand, the lumber market maintains a steady tone. Prospects for the future have been improved by the better outlook for the crops. The bulletin issued by the Ontario Department of Agriculture calls attention to the damage to fall wheat by winter killing, but since the beginning of May the weather has been favorable for the recuperation of the crop and the latest reports indicate that many of the fields are making an encouraging recovery. A large yield of grain will likely bring about a heavy demand for lumber in the fall. Present shipments to the United States are not all that might be desired, but dealers report a very satisfactory local trade, with no signs of an early falling off. There may be a readjustment of prices after midsummer on account of the usual inactivity preceding the Presidential election across the border, but the general average is not likely to be reduced materially. Hardwoods are meeting with a ready sale. The old stock is practically cleaned out and dealers have experienced some difficulty in filling orders for certain sizes. Soft elm and birch lead in point of activity. An increased inquiry for beech is reported. One year ago this lumber was selling at $14 for log run, while sales have recently been made at $18. It has been found to be a very satisfactory substitute for certain higher-priced woods.

QUEBEC AND NEW BRUNSWICK.

The spruce lumber market is still in an unsettled condition. Some shipments are being made to the United States, but there is very little buying for the British market. The price of merchantable spruce logs is now about $9 per thousand, and that of lumber $11 per thousand. This is a decline of over $2 as compared with the prices ruling one year ago. There is practically no demand for logs at the present time, and mill men who contracted for their supply some time ago at higher prices will sustain heavy losses unless conditions improve. The financial embarrassment of a large Fredericton lumberman, referred to elsewhere, has emphasized the necessity of taking every precaution against possible loss. There are two factors, however, that are favorable to the lumber market. The first is that the stock of dry lumber carried over from last year was very small, and the second is the probability that a large percentage of the logs taken out the past winter will not reach the mills this year.

J. S. FINDLAY, OWEN SOUND ONTARIO.
HARDWOOD LUMBER AND MAPLE FLOORING.
MAPLE FLOORING well made is half laid. My Factory is equipped with the very latest and best machines for turning out Flooring, and we give its manufacture our exclusive attention, believing it best to DO ONE THING AND DO IT WELL. End-matched, Bored, Polished, Hollow-backed etc. Will quote prices delivered any point.

The St. John river has fallen fully five feet from the highest level reached this spring. Estimates of the quantity of logs which may be hung up range from 30,000,000 feet to 60,000,000 feet. While there is so much uncertainty as to the log drives, there is little possibility of lumber prices going any lower, while in the natural course of events they should improve somewhat.

UNITED STATES.

The developments in the United States lumber market during the past week call for no lengthy comment. The country demand continues very slow. In some districts there is a disposition to crowd stock on buyers, with the result that prices have an easier appearance. Dealers are not buying in large lots, believing that this is the safest course to pursue until general business conditions improve. Under the influence of warm weather the crops are looking better. Corn planting has been completed and the growth is beginning to make headway. The demand for low grade pine lumber is quite up to the mark, but other grades are dull. Hardwoods are moving in moderate volume, maple, basswood and elm furnishing the most activity. The latter is scarce in the Tonawanda, Buffalo, and other eastern markets, and prices on this lumber are likely to remain very firm throughout the summer. Thick maple sells well.

The demand for shingles is only moderate. Red cedars have declined fifteen cents within the past three weeks. White pine shingles are scarce on account of the lake tie-up, which has kept prices firm. Lath is picking up as the amount of building increases.

GREAT BRITIAN.

Contracting for the future is still being conducted by British lumber merchants upon most limited lines. While there has been some improvement in the demand, there still exists a feeling that existing conditions will prevent more than a very moderate rise in prices from the present basis. Without wishing to inspire false hopes, however, it may be said that prices are not likely to go much lower. The consumption is making considerable inroads upon yard stocks, and as the quantity contracted for is exceptionally small, it is quite possible that when the dealers enter the market to replenish their stocks it will bring about an advance in prices. Representatives of Canadian spruce shippers have experienced a little more success of late in closing contracts, the prices being about £9 10s and £8 15s c.i.f. London for 3x9 inch second and third qualities. Red pine is, if anything, lower in price, sellers having in some instances offered to meet Baltic quotations.

CANADIAN LUMBER SHIPMENTS.

From St. John: Schooner James L. Maloy, for Providence, 35,187 ft. plank, 25,011 ft. scantling, 570,000 laths. Schooner Lena Maud, for Quincy, 1,446,000 cedar shingles. BRITISH COLUMBIA LETTER.

(Correspondence of the CANADA LUMBERMAN.)

VANCOUVER, May 23rd, 1904.—Until there is some relief in the way of duty, prices will not amount to much in connection with the trade with the Territories. So much lumber is being dumped into that market that it is completely demoralized, and as the Americans are selling for what it will bring in most cases, prices cannot be maintained by the British Columbia lumbermen. The American wants cash, and he considers it a snap to be able to dispose of the large surplus of rough lumber in some market other than his own. What he loses on that he makes up on the finer grades, for which there a ready demand and good prices in his own country. Then, too, the difference is made up in the middle western states, where a sufficient increase is put on rough lumber to offset the loss of disposing at a sacrifice in the Canadian Territories. What trade comes to this province is only in competition with the ruinous prices inaugurated by the manufacturers in Washington state. This is one of the reasons that the Hastings mill, the largest establishment of the B. C. Mills, Timber & Trading Company, has shut down, and more will follow very soon.

All the Boards of Trade on the Coast, assisted by many in the interior, have taken the matter up, and memorials which have been addressed to the government at Ottawa since 1896 have been supplemented, and a representative deputation will wait on the Government this week to ask for an equalization of the tariffs. Free trade they prefer, but at least an equalization. This deputation is composed of Mr. John, Hendry, president ot the B. C. Mills, Timber & Trading Company, of Vancouver; Mr. A. C. Flumerfelt, of Victoria, and Mr. Harry Watson, a prominent member of the Vancouver Board of Trade. They will be presented and assisted by the British Columbia members, all of whom favor the lumbermen's requests.

Mr. George McCormick, of Orillia, Ontario, one of the stockholders of the Pacific Coast Lumber Company of this city, and one of the principals in the Kamloops Lumber Company, which has recently been re-organized, was in the city last week. The reputed cause of his flying visit to the coast was to tender the payment of dues on timber on land which was to be auctioned by the Government. He had held it for a number of years, knowing that the Vancouver, Westminster & Yukon railway was to go through, and would afford him transportation facilities to get the timber out, and now when the time has arrived, and the railway under course of construction, his dues are refused, and the land with the timber on it will go.

New freight schedules on lumber and shingles have been issued by the C.P.R. to the manufacturers in the Kootenay, who are organized into the Mountain Lumber Manufacturers' Association. A reduction of 2 cents per 100 pounds has been granted. As green lumber weighs about 3,000 pounds to the 1,000 feet, the reduction amounts to 60 cents per 1,000 feet on green lumber, and less on kiln dried lumber. In return for the concession, the lumbermen have agreed to sell their product for $1 per thousand less to the settlers. The reduction is 40 cents to the lumbermen per thousand.

VERY SATISFACTORY RESULTS.

Mr. R. E. Kinsman, lumber merchant, Hamilton, Ont., writes: "My contract for advertisement (in the weekly CANADA LUMBERMAN) has expired, but I wish to continue it for another year, having had very satisfactory results." If you wish to sell or buy lumber or anything connected with the manufacture of lumber it will pay you to advertise in THE CANADA LUMBERMAN.

TIMBER LIMITS.

Many persons have sold valuable timber limits by means of a small advertisement in the Wanted and For Sale Department of this paper. Expense small—results sure.

BUSINESS NOTES.

The lumber trade learned with regret of the financial embarrassment of Robert A. Estey, who conducted large operations on the Tobique and Rockaway rivers, with mills at Fredericton, N.B. The failure is attributed to Mr. Estey's impaired health and to the depression in the lumber trade.

At a meeting of creditors held at St. John on May 27th, a statement of his affairs showed liabilities of $135,000 and assets of $105,000. The largest creditors are said to be John E Moore, George McKean, The Peoples Bank of New Brunswick, and the Provincial Government, the latter having a claim of $12,000 for stumpage dues. Mr Estey took out last winter over 10,000,000 feet of logs, of which 4,000,000 were sold at $11 per thousand feet.

SHIPPING MATTERS.

The following charters are reported: Barque Ophelia, Campbellton, N.B., to Adelaide, Australia, deals, 60s, August loading; barque Sorronto, St. John, N.B., to Valencia, deals, 48s 9d; steamers Artic Stream and Belfast, St. John, N.B., to Melbourne, Australia, 57s 6d and 52s 6d respectively: barque India, Halifax, N.S., to Southampton, deals, 40s.

The steamer Powhatten has been chartered to carry deals from St. John, N.B., to west coast of England, at private terms.

THE CANADA LUMBERMAN

VOLUME XXIV. NUMBER 6. | TORONTO AND MONTREAL, CANADA, JUNE, 1904 | TERMS, $1.00 PER YEAR SINGLE COPIES, 10 CENTS

THE CROW'S NEST PASS LUMBER COMPANY.

The lumber industry of British Columbia has developed very rapidly in late years, for which the operations in the Kootenay district have been largely responsible. Of the many new mills erected in that section of country, the establishment of The Crow's Nest Pass Lumber Company at Wardner represents one of the largest and most modern. The saw mill proper is equipped with a double-cutting band sawhaving a capacity of 75,000 per day, and another double-cutting band of similar size is being installed, which will bring their output up to 150,000 feet per day of ten hours. The planing mill is equipped with five machines and is so situated as to permit of the economic handling of all materials to cars. The dry kiln, just completed, has a capacity of 50,000 feet per day.

The location of the mill is very favorable to supplying the lumber demand of Manitoba and the Territories, and they will no doubt secure a large share of that trade. They have excellent facilities for shipping, their side-track being directly alongside the Crow's Nest branch of the Canadian Pacific Railway, and they can handle from sixteen to twenty cars at their loading platform at any one time.

Their timber consists of western white pine, tamarac, and mountain fir, averaging about 60 per cent. pine, 25 per cent. tamarac and 15 per cent. fir. The merits of western white pine as a building material are well-known. The excellence of tamarac for inside finish is now admitted, while the Mountain fir of the district being of a coarse nature, is seldom used for any other than dimension and mine timbers. It is very desirable in this connection on account of its strength and durability.

The officers of The Crow's Nest Pass Lumber Company are : President, John Breckenridge ; vice-president, William Carlin ; managing - director and secretary - treasurer, Peter Lund. They will cut this season about 20,000,000 feet of timber and expect to operate their plant day and night :

NEW SAW MILL OF THE CROW'S NEST PASS LUMBER COMPANY, WARDNER, B. C.

THE TIMBER OF QUEBEC.

The Quebec Colonization Commission, in their recent report, thus refer to the timber wealth of that Province.

Nobody has any idea of the wealth of the forests of the Abittibi territory. White pine is found on the hills and isolated rocky mounds as far north as the latitude of Lake Abittibi, and so is red pine. White cedar of fine growth extends as far as Gull Lake more than a hundred miles north of the height of land. White birch and balsam fir are large, indicating rich soil. But the most abundant and richest timber consists of black and white spruce. On the banks of the rivers and the shores of the lakes there are many white spruce trees from 24 to 30 inches in diameter and Mr. O'Sullivan saw some over 100 feet high. The red spruce or tamarac, which was splendid, has been almost entirely destroyed by the insect whose ravages have destroyed it everywhere else. But this insect has disappeared and before many years there will be plenty more of that wood. These extensive forests of black and white spruce border on the rivers where there are immense water powers, and the whole of this country is one of the most favorable for the pulp and paper industry.

"The white and red pine," says Dr. Bell, "extend from the southward for a short distance beyond the height-ot-land. Banksian pine is found, where suitable conditions exist, as far as Mattagami Lake. Tamarac or larch is abundant and a fine growth, but unfortunately most of the trees throughout the whole district from Grand Lake to James Bay, have been attacked by the grub of the recently imported larch saw fly."

"White spruce is perhaps the most valuable tree of the district explored. It grows to a great size everywhere along the rivers and lakes, and although as a rule it may be large near their banks, where it often girths upwards of six feet, a considerable proportion of the trees inland also attain a good size. In point of numbers of individual trees, the black spruce takes first rank, and a large proportion of them are of a sufficient size for various useful purposes, such as fuel, building, railway ties, and wood for papermaking. Balsam fir grows in perfection and is abundant throughout the district. White cedar is confined principally to the margins of lakes and rivers. Its northern geographical limit is slightly beyond the region explored and it becomes scarce as we approach James Bay. White or canoe birch is a thrifty and abundant tree everywhere. Aspen or trembling leaf poplar is the most common deciduous tree. The balsam poplar was not observed in the southern part of the great basin, but was plentiful in the northern part. The timber is almost everywhere of mature age, or consist of old second growths."

"In the virgin forest," writes Mr. O'Sullivan, "white spruce, balsam fir, red spruce, Banksian pine, are the principal conifers ; deciduous trees are represented by the various species of poplar, birch, willow, alder, with here and there black ash on the banks of rivers and the shores of lakes. There is an abundance of spruce and tamarac, which assures a supply of pulp-wood for ages to come."

Estimating at the low figure of 1,600,000 feet of spruce to the square mile on an average, the 60,000 miles comprised in the Abittibi territory would contain about one hundred billion feet of spruce. The report of the Commissioner of Crown Lands says that in 1901 there were manufactured throughout the Province of Quebec 359,848,020 feet of spruce, say 360 millions in rounds numbers. The forests of Abittibi could supply that yearly cut for over 275 years.

The Lumber Situation in British Columbia

IMPORTANT MEETING AT VANCOUVER.

The conditions under which the lumber industry of British Columbia is at present conducted are anything but satisfactory, and as a result the large saw mill of the British Columbia Mills, Timber and Trading Company at Hastings, a suburb of Vancouver, has been closed down until such time as there is an improvement in conditions governing the market. The bottom has, for the time being, fallen out of the foreign lumber market, and it is not possible to find a profitable market in the North-West Territories and Manitoba, largely owing to the fact that the mills near the border in the United States are using the Canadian North-West as a slaughter field for their surplus stock so as to prevent over-production in their own market. The British Columbia mills situated near the coast are more seriously handicapped than are the mountain mills, which are more favorably located to supply the North-West.

It is understood that the Pacific Coast Lumber Company and other large concerns have practically decided to close down at an early date unless some protection is afforded the industry by the Dominion Government, this being the natural result of existing conditions. The persons who have invested money in the business consider that the loss will be greater by operating the mills than by closing down.

At the last monthly meeting of the Vancouver Board of Trade there was a very full discussion of the present condition of the lumber industry, and the result was that a resolution was passed to the effect that an equalization of the duty between Canada and the United States is immediately required insofar as the lumber tariffs are concerned.

Mr. E. H. Heaps, of E. H. Heaps & Company, stated that up to the present time the lumbermen had been able to fight their own battles, but now they feel the need of the aid of every business man of the community. He did not wish to say that the lumber trade is bad or even sick ; there are many seemingly bright prospects ahead, but the British Columbia lumbermen are threatened by American competition in the Northwest and in Manitoba. It has been asked why Canadian mills cannot compete with the American mills. The Canadians are discriminated against in many ways. The City Council had raised the water rates because the mills employed Chinese ; the insurance companies had raised their rates, and the Provincial Government assessment had seriously affected the industry. The only manner of relief is to put a duty on lumber entering Canada. Mr. Heaps had reason to believe that between 9,000,000 and 10,000,000 feet of lumber per month was entering the North-West and Manitoba from the American side. If that trade were preserved to the mills of Vancouver it would keep all the mills running night and day.

The speaker said he had reason to believe that a duty on lumber could be secured if the matter were pushed. The British Columbia Lumber & Shingle Manufacturers' Association is doing all it can to bring about that end. The Americans have a larger market and cheaper supplies than Canadians, whose only large market is in the North-West and Manitoba. There are now many immigrants coming into the North-West, and the prospects for a large trade this year are good. The trade this year will be as large as last, but the great point is to hold it. The people of Manitoba cannot say that there is not sufficient lumber turned out in Canada to satisfy the demand, nor can they say that there is not enough competition in the country to keep prices down to a reasonable figure. A larger market is required by the British Columbia lumbermen, and if it cannot be secured the lumber industry will be checked.

PROTECTION NEEDED.

Mr. J. G. Scott, manager of the Pacific Coast Lumber Company, said that he was glad to see the Board of Trade taking an interest in the lumber industry, and the conditions surrounding it. The Government preceding the present one had placed lumber and shingles on the free list as a reciprocal action when the Americans had taken the same action in connection with Canadian lumber and shingles. Later the Dingley tariff had come into force in the United States and imposed a duty of thirty cents on shingles and $2 on lumber, but Canada had taken no action against American lumber interests, despite the representations of Canadian lumbermen that a protective tariff should be established in retaliation. American competition has bothered Canadian lumbermen more this season than ever before. There has been an overproduction across the line, and foreign markets are slack. The Americans therefore use the North-West and Manitoba as a dumping ground for their poorer material, while they preserve their own country as a market for their best. It is true that Canadian lumbermen are invading American markets, but they are doing so in the face of the tariff.

FAIR PLAY ASKED.

Mr. C. M. Beecher, vice-president of the British Columbia Mills, Timber & Trading Company, said that all the lumbermen wished was fair play. He did not wish to mix politics with the discussion, but it was a fact that the lumber industry in Canada had suffered from the actions of the Conservative party. When the American free trade movement had come into effect the Ottawa Government had promptly met it and had reciprocated, and that was fair play, but in 1896 representations had been made to Ottawa that on the American side the Dingley tariff was to go into effect, and the Government had been asked to advise Washington that if the said tariff was placed against Canadian lumber and shingles this country would be forced to retaliate, but no action was taken. Had their been, the American duty would never have been put on. The lumbermen in this country have repeatedly asked Ottawa to equalize tariff conditions, placing against the entry of American lumber such duty as the United States places against the entry of Canadian lumber into that country. This is all the lumbermen desire, and that is fair play.

Mr. Beecher said that few people realized the value of the lumbering industry to this province, but they would if they stopped to consider what it meant with its ramifications. If it is killed the people will be paralyzed at the effect upon the general prosperity of the community. Mr. Beecher said that he was not drawing upon his imagination in the relation of what the present condition of affairs is, but he was placing facts before the meeting and prophesying just what would happen in spite of all the lumbermen could do unless some measure of relief was afforded the industry. He said that the lumbermen in Canada face competition in the East from darkies and ticket-of-leave men, who work at very low wages, and in Manitoba they are face to face with the strong competition of the manufacturers of Wisconsin and Michigan, where lumber is manufactured much cheaper than it can be on this coast. The worst competition of all, however, is right here at home from the lumber mills in the State of Washington. The lumbermen in that state can operate their camps much cheaper than the lumbermen on this side can operate theirs, as supplies and everything else for mill equipment is cheaper by 25 to 30 per cent. than in this province. The Puget Sound mills have their own immense market of 80,000,000 people, and have Alaska, Hawaii, and now the Phillippines. From 1894 to 1896 the Canadian lumbermen had a chance to do business in the United States, but as the American patronized home industry Canadian competition was unable to secure a footing there. The Puget Sound mills have the advantage in the cost of supplies and in their enormous home market, and they have the best of the foreign trade in Australia, China and Japan. It is utterly unreasonable that the Americans, having these enormous advantages over Canadians, should be allowed to ship into the only market the British Columbia mills have, a somewhat restricted area in the Northwest.

Mr. Beecher said the one matter of surprise to him was that the Canadian mills had been kept running, and he could only think that it was because the millmen here were a little smatter than the Americans. He said that the millmen had not come to this meeting as mendicants ; all they wanted was fair play. He said he did not wish to close the Hastings mill if it could be helped, but certainly it would not be run at a loss.

SUPPLIES COST MORE.

Mr. J. W. Hackett, of the firm of Robertson & Hackett, sawmill operators on False Creek, vouched for the accuracy of all the remarks of the previous speakers. He said that the lumbermen in this country had come to be looked upon as a set of thieves. Everywhere he went he was asked when the price of lumber was to be reduced. Public opinion had formed the

impression that the price of lumber was higher than it should be. Mr. Hackett said that saws fit to cut British Columbia timber were not manufactured in Canada. They had to be imported from the United States, where they cost from $150 to $160, and added to that was a duty of thirty per cent., which had to be paid for the entrance of the goods into Canada. Belts were in the same category. He said that with the cost of supplies so much higher here than on the other side there was no room for unfair competition. He said that the insurance rates charged mills were exorbitant. The general rate was 9¼ per cent. and the rate of 13½ per cent. on the mills proper was so high that the insurance companies were ashamed to publish it.

APPEAL TO THE GOVERNMENT.

Mr. W. G. Harvey then moved that the board endorse a petition that the millmen had forwarded to the Government. Mr. R.P. McLennan seconded the motion, and said that the request of the lumbermen was a modest and reasonable one, and unless something were done the province would find itself in a state of commercial depression shortly. The resolution was carried unanimously, as follows:

"That the Vancouver Board of Trade realizes that the general commercial interests of British Columbia require that an equalization in the duty on lumber be established immediately between the tariffs of Canada and the United States, otherwise serious commercial depression will prevail throughout this province."

The Boards of Trade of all the leading towns and cities in British Columbia have endorsed the resolution in favor of a duty on lumber, and have agreed to the suggestion that a delegation be sent to Ottawa to impress the matter upon the Government. Money has been willingly subscribed to pay the expenses of the delegates.

VIEWS OF PROMINENT B. C. LUMBERMEN.

Mr. R. H. Alexander, Secretary British Columbia Mills, Timber and Trading Company:

"The foreign export trade here is in almost a state of collapse owing to the mad competition which has arisen through the multiplicity of mills and the consequent overstocking of the market, resulting in prices being brought down to away below the cost of production. There is no doubt that when a good deal of the old stocks which have accumulated during the past three years of excessive production are cleared off and the mill men have to face manufacturing at a loss, that prices will come up, as logs are as high to-day as when lumber was 50 per cent. higher. The condition of the domestic trade is in just as bad a shape as that of the foreign. To arrive at a just conclusion as to the causes of this deplorable state of affairs, one must not lose sight of the fact that trade here is really ruled by what is going on in the United States. For the past three years there has been a big demand for lumber all along the coast, especially in California and as far east as St. Paul and the Missouri River. This led to a big increase in the producing capacity, saw mills being started by the dozen. Since then the demand in California and the east has fallen off, so that the mills are striving as well as they know how to dispose of their stocks, and as a result prices have been reduced to a very ruinous figure. When the California trade falls the great difficulty is to market the common grades of lumber which are usually manufactured in the proportion of 5 to 1. Enormous surplus stocks of these lower grades have accumulated in the hands of the mill owners across the line, resulting in their being completely jammed up. They have been agitating during the past two months for a 40c. rate to Omaha and the Missouri Valley, hoping to secure some amelioration of the present condition by an outlet into that market. However, nothing has resulted from that source as yet and in the meantime they must sell, the whole question reducing itself to one of securing hard cash for their fast accumulating stocks irrespective of prices and cost.

"We, unfortunately, are in much the same position, manufacturing in the same proportion, but with the disadvantage of possessing no home market except British Columbia, which is practically nothing. The natural market for us is the North-West, and there we are being undersold by the Americans making it the dumping ground for their surplus stocks. Whichever way one views the situation the advantage is with the Americans. They manufacture in larger volume, possess a larger market, pay less for their supplies, while all their machinery and saws cost less. Without the tariff we could get things from Puget Sound cheaper than from Manitoba and the Territories, and yet although afforded no protection whatever we are taxed to support the Manitoba farmer. All conditions make it dearer to manufacture here than on the Sound. Last November trade practically stopped in the North-West. Since then both the government agent and the C.P.R. have been urging the mill owners here to be ready to supply the demand which was sure to arise with the inrush of immigrants in the coming spring. Acting upon this advice they have accumulated tremendous stocks, but unfortunately, owing to the bad season nothing was done until two weeks ago, when symptous began to arise of better trade. Now when they have all prepared they find themselves shut out by American competition, with the result that unless they are prepared to sell at a sacrifice no lumber will be shipped at all. It means destruction to the industry, as it is impossible to sell clear grades and pile up five times as much rough lumber. The only remedy is for the government to put a duty on American lumber and provide us the market we lack. That the institution of a tariff on the importation of the cheap grades of American lumber would hurt the settler is the merest clap trap, as he pays the usual price of lumber whether it be cheap or not, the retailer seeing to this and under no circumstances allowing any reduction whatever unless it be for trade. Furthermore, the average settler's house and barn never requires more than 16,000 feet of lumber and a duty of $1.00 per 1,000 would be merely an atom of a cost to him compared to the loss he would suffer by the reduction of the purchasing powers of his best customers. There is no industry that disburses so much among the general public in the shape of wages, steamboat charges, etc., as the lumber trade, it being estimated at $9 to the public for every $1 gained by the manufacturer. Were a mill with an annual output of say $500,000 to close down the general public would lose $450,000 to the $50,000 lost by the owners. The loss to the community collectively is far more serious than can possibly be estimated. Let the government either grant protection or at least place us in a position of equality with the Americans."

Mr. J. D. McNair, of the Hastings Shingle Mill Company:

"The company, in view of the present market conditions, are curtailing their output. We now average 400,000 shingles a day, while our capacity is over 1,000,000. We have felt the depression approaching ever since the Americans began to compete for Canadian trade owing to the depression in their home market more than a year ago. As the condition of the United States market has not improved but on the contrary grown worse, this competition has become keener, until to-day prices are so low and the state of the market so bad that the mill owner who would think of increasing his capacity or of building new mills would certainly be considered insanely mad by the associated lumbermen of the province." Proceeding, Mr. McNair went on to say that immediately after the burning of their lumber mill last October he, in company with Mr. Flumerfelt and associates, considered the advisability of rebuilding and were unanimously agreed upon constructing a mill with double or treble the capacity of the one burnt, which when running manufactured on an average 50,000 feet of lumber and 200,000 shingles per day, provided the Laurier Government could be induced to grant some adequate protection from the ruinous competition which he, Mr. McNair, saw approaching as a result of the fast growing depression in the United States markets. In a letter read by Mr. McNair to the writer, the humiliating spectacle was brought to view of the British Columbia Lumber and Shingle Association appealing to the United States Consul in Vancouver, Col. Dudley, for a correct interpretation to his government of the recently enacted logging act. Such an occurrence, says Mr. McNair, is proof itself that the British Columbia lumbermen were growing tired of the apathy of the government at Ottawa, and were ready to appeal to the lumbermen of the Pacific Coast states for assistance. Loyalist as he was, he was convinced that unless something was done by the Dominion House to ameliorate the present conditions the day was not far distant when the Canadian people would receive a rude awakening in the demand from British Columbia for separation.

A LUMBER SCALE.

The Vulcan Iron Works, of Seattle, Washington, have for their friends and patrons a large number of pocket scales, which can be had by postal or verbal request. They are very neat and convenient.

The LUMBERMAN Weekly Edition is published every Wednesday, and the Monthly Edition on the 1st day of every month.

TERMS OF SUBSCRIPTION:
One Copy, Weekly and Monthly, One Year, in advance, $1.00
One Copy, Weekly and Monthly, Six Months, in advance, 50
Foreign Subscription, $2.00 a Year.

ADVERTISING RATES ON APPLICATION.

THE CANADA LUMBERMAN is published in the interests of the lumber, wood-working and allied industries, being the only representative in Canada of these important interests. It aims at giving full and timely information on all subjects touching these interests, and invites free discussion by its readers.

Especial pains are taken to secure for publication in the WEEKLY LUMBERMAN the latest and most trustworthy market quotations throughout the world, so as to afford to the trade at home and abroad information on which it can rely in its operations. Subscribers will find the small amount they pay for the CANADA LUMBERMAN quite insignificant as compared with its value to them. There is not an individual in the trade, or specially interested in it, who should not be on our list, thus obtaining the present benefit and aiding and encouraging us to render it even more complete.

Advertisers will receive careful attention and liberal treatment. For manufacturing and supply firms wishing to bring their goods to the attention of owners and operators of saw and planing mills, wood-working factories, pulp mills, etc., the CANADA LUMBERMAN is undoubtedly the cheapest and most profitable advertising medium. Special attention is directed to "WANTED" and "FOR SALE" advertisements, which are inserted in a conspicuous position on front page of the Weekly Edition.

OUR WINNIPEG BRANCH.

The publishers of this Journal have recently opened a branch office at No. 320 McIntyre Block, Winnipeg. A resident representative has been appointed who will be exclusively employed in advancing the circulation of this Journal and in keeping our readers informed regarding the latest developments throughout the West. The kind co-operation of our friends in the west is solicited in behalf of the success of this enterprise.

RAILROADS AND FOREST FIRES.

The subject of forest fires was carefully considered at the recent meeting of the Canadian Forestry Association, and the outcome was the adoption of the following resolution:

"Resolved, that in view of the proposed construction of a new transcontinental railway and the projection of other lines passing largely through coniferous forests, the attention of the Governments of the Dominion and the Provinces, aud also of the Railway Companies, be called to the serious danger of loss of valuable timber consequent upon the construction and operation of such lines if all possible precautions to prevent the starting of fires are not taken, and urge that the question be given full and careful cousideration, that to the end sought the party or parties contracting to build the different sections of the said road be required to enter into an agreement for an efficient equipment and control to prevent fires, that at such seasons as may be necessary an effective patrol be established along all the afforested line of railway, and that the officers both of the governments and the railways be required to use all possible diligence to prevent the starting or spread of fire through defective equipment or through the carelessness of the operations or negligence of the employees under their control".

The destruction which may be done to the forests of Canada while the construction of the proposed transcontinental railway is in progress is very great, and the above resolution is particularly timely. The benefit which the country will derive from the building and operation of the road will be largely offset if every precaution is not taken to prevent the spread of fire through the heavily timbered country through which it will pass for a considerable distance. That the railways are responsible for many forest fires will scarcely be disputed. Of twenty-eight fires which occurred last year in Wright County, Minnesota State, from known causes, eight were due to railroad locomotives. In France the railroad companies are held responsible for damage by fire caused by flying sparks from their locomotives, and consequently they take particular care and in exposed places cut the grass and brush adjacent to their road beds.

Remembering the great territory comprising this Dominion, 3,745,000 square miles, it is apparent how difficult it is to prevent forest fires solely by the employment of rangers if the public are ignorant of their responsibility or neglectful of their duty. It is surprising that so many persons will set out a fire in or near a forest and take no pains to see that it is extinguished. The posting of warning notices, the diffusion of information regarding the value of the forests and the necessity of their protection, and, finally, the prompt prosecution of those who violate the law, should gradually tend to do away with the evil of forest fires in this country.

THE QUESTION OF A LUMBER DUTY.

The lumber manufacturers of Canada, and of British Columbia in particular, have at last got the ear of the Dominion Government, and it appears that a crisis in the question of an import duty on lumber is near at hand. The subject was brought up in the House by Mr. Morrison, member for New Westminster, B.C. He reviewed the conditions surrounding the lumber industry of British Columbia and pronounced himself strongly in favor of an import duty equivalent to that which is imposed on Canadian lumber exported to the United States. He was supported by the Conservative members as a whole and very earnestly by Mr. Macpherson, the Liberal member for Burrard, B.C. Mr. Macpherson pointed out that during March last no less than 390 cars of lumber had gone into Winnipeg from the United States. They averaged from 8,000 to 10,000 feet per car, which at $16.50 per thousand were worth $64,300. He was something of a free trader, but he was also something of a protectionist, and he believed in applying the knife whenever it was necessary. The people of the United States should be obliged to do exactly by Canada as Canadians did by them, and one Province should not be sacrificed to the interest of the other.

The suggestion of a duty on lumber was strongly opposed by the representatives from Manitoba and the Territories, whose arguments against granting a duty were based on the necessity for giving the farmers of the North-West cheap lumber. This is the sole argument that can be advanced to justify the indifference of the Dominion Government in protecting the Canadian lumber industry to the extent that other industries are protected, and it is very doubtful if this argument has not outlived its usefulness. Has the time not arrived when the Canadian North-West should bear its share in building up the industries of this country? Everything the farmers in question produce or manufacture is protected by heavy duties from American competition. There is no reason to anticipate, however, that the people of the North-West would be compelled to pay more than a reasonable price for their lumber if United States competition were eliminated. The imposition of the duty would encourage the building of more mills, and the present capacity of mills in a position to cater to the North-West market is sufficient to more than supply the demand. There is no good reason, therefore, why some protection should not be afforded the lumber interests.

In the framing of tariffs consideration is given to the consumer, the free importation of goods being permitted when it is apparent that the home protection is not equal to the demand. Then why has the lumberman been selected to carry the burden of United States competition in his own legitimate market, when other industries are protected? The British Columbia millman contends that he is obliged to import a large proportion of his mill and logging equipment—saws, axes, belting, etc. All these are dutiable, yet he has not been forced to pay exorbitant prices on account of this protection. Much less would the consumer of lumber suffer by a duty.

FIXING OF TIMBER SLIDE DUES.

A judgment recently delivered in the Divisional Court by Chief Justice Street in the case of Beck versus Ontario Lumber Company, has caused some discussion in lumber circles. It appears that the Ontario Lumber Company had used certain improvements owned by the C. Beck Manufacturing Company on the Post Creek for floating their logs, and, in accordance with the law, the latter company made application to the County Judge to fix the dues to be paid by persons using these improvements. The Judge, in fixing the tolls, did not specify whether they were applicable to logs floated down in the past as well as in the future, or in the future only, and the Beck Company claimed that it was intended to apply both in the past and in the future. The Ontario Lumber Company appealed, and the higher court sustained the appeal, the judgment reading: "I cannot find any authority for the position that a person who has made improvements upon a stream can obtain from the District or County Judge an order fixing tolls to be paid upon logs which have been floated over them previous to the making of the order. A contrary interpretation would entitle the owner of the improvements to go back for six years and recover tolls fixed in 1900 upon logs floated down in 1894, for instance."

The counsel for the plaintiff pointed out, with some reason, that as the quantity of logs which would be floated down a certain stream, in conjuntion with the cost of the improvements, should form the basis for fixing the amount of dues to be paid, it would be difficult to fix the tolls before knowing the exact or at least the approximate quantity. Against this argument it was claimed that it is always possible to ascertain in advance, within a

reasonable limit, the quantity of logs which are likely to come out of a certain stream, the operators usually being known by the party or parties owning the improvements. Another point to which consideration was doubtless given is that a person should know what he is expected to pay for certain privileges before the liability is incurred, in this case before the improvements are used. It might be that, with advanced knowledge of what the dues are to be for the use of the improvements, he would find it more economical to have the logs floated on another stream.

The Beck Manufacturing Company, Limited, owning the improvements, and not having incorporated an improvement company for that purpose, are limited to the power which is vested in the County Judge, to whom the Ontario Act does not give authority to fix tolls for logs which have already passed over the improvements. If, however, the conditions are such as to make it advantageous to have the tolls fixed after the logs have been floated, a means has been provided by the incorporation of a company as owner of the improvements. The improvement company can then fix its schedule of charges, even after the work has been performed. If the charges are not acceptable to the persons having made use of the improvements, they may be submitted to the Commissioner of Crown Lands, who will take evidence and has full power to make such changes as he considers are justified by the circumstances. This is the law as we understand it.

EDITORIAL NOTES.

Just as the single band saw succeeded the circular saw in many mills, so the double cutting band is taking the place of the single band in the larger mills. In British Columbia it has been installed in nearly all the new mills. Experience has demonstrated to the satisfaction of many lumber manufacturers that the double cutting band is capable of turning out lumber equal in every respect to that produced by its single competitor, while its capacity is very much greater.

The culling and measuring of lumber in the Province of Quebec was fixed by statute in 1886, and we are not aware that any changes have since been made. The Act as it stands is absolete. The market requirements have made it necessary to adopt a more defined classification, consequently some of the grades of timber and lumber now manufactured are not covered by the Act. Would it not be in order for the Government to appoint a committee to revise and enlarge the rules with a view to bringing them up-to-date?

The Douglas fir of British Columbia is finding increased favor in Eastern Canada, but it should be used to a still greater extent. Large quantities of Georgia pine and cypress and other southern woods are being used in construction work, the lower freight rates and free entry into Canada giving the southern product an advantage over British Columbia timber. Where quality is considered, however, the latter should be given the preference, as it is stronger and more durable and will withstand the effects of water admirably. Canadians should use more of the B.C. timber.

Doubtless many purchasers of Scribner's Lumber and Log Book have expected to find therein Scribner's rule for the measurement of logs. Instead the Doyle rule is given. It appears that some years ago J. M. Scribner published a small book which he called Scribner's Lumber and Log Book and which contained Scribner's rule. Later on Edward Doyle prepared a log table which he claimed was more nearly correct than Scribner's. George W. Fisher became the owner of the Scribner book and copyrighted it. After comparing the two log tables and taking advice of experienced saw mill men, he adopted the Doyle rule as being the more nearly correct. Hence we find the Doyle rule in the Scribner book. Scribner's log rules have been out of print for perhaps thirty years. George W. Fisher's copyright expires on the Doyle rule in 1910.

ELEVATED LOGGING TRAMWAY.

All persons engaged in lumbering operations will be interested in the following description and accompanying illustration of an elevated mono rail logging tramway, invented by Mr. A. R. House, 556 Powell street, Vancouver, and the property of the Vulcan Company, of that city. The tramway is constructed of rough logs about 15 inches in diameter. A single track requires four logs, and a double track seven logs for the construction of the trestle work, and a single line of stringers to carry the rails. The stringers are placed continuously from trestle to trestle along the entire length of the tramway. The trestles are framed in a manner to receive the heavy strains on the ends of the timber. They are set up 25 feet apart with intermediate posts midway between them to support the centre of the stringers and prevent any sag. The caps of the trestles are projected three feet beyond the framework, strengthened by a raking log underneath resting on the ground. The stringers carrying the rails are placed at the extreme ends of the caps, scarfed and bolted thereto. On these timbers the rails are laid. Carriers running on the rails are in the form of the bicycle, with single grooved wheels at each end of the frame. Two iron rods, one at each end of the carrier, bent in the form of a hook, are attached to the carrier near the wheel, and pass downward outside and underneath the stringer, free from contact with any part of the sructures. On the ends of the blocks are two small wheels, which run on a guide rail, attached to the framework, and keep the carrier in an upright position and the load from oscillating laterally. The logs for transport are suspended to these hooks by chains.

The trains are drawn by a steam engine running on the rails, with a boiler car suspended underneath the line which acts as a counterpoise to the engine. By this system of tramway it will be seen that grading, removal of stumps, fallen logs, rocks, and other impediments are avoided.

A company has been formed in Vancouver to construct tramways, elevated or surface, for mining, logging, passenger, freight, etc., under the management of Mr. J. P. MacLean, mining, hydraulic and civil engineer.

ELEVATED LOGGING TRAMWAY INVENTED BY ALFRED R. HOWSE, VANCOUVER, B. C.

NO. 3 CUTS.

We have been asked to state what constitutes the grade of No. 3 cuts in white pine. Although there are no printed rules that we can find covering this grade for Ontario, we would say that No. 3 cuts are supposed to cut about 33⅓ per cent. clear cutting, free from shake, knots, or any other defects. The balance of the piece may be knotty or faulty in other respects. Bright sap would not be considered a defect. The cutting should be either fit for panels, rails or stile. Panels should be 8 inches wide, 3 feet long; for rails, 6 inches wide, 7 feet long. Inch lumber would have to give panel cuts, as it would not answer for rail or stile.

A correspondent of the London Timber Trades Journal gives the following as the best speeds for band sawing machines: If saw pulleys are 30 inches diameter, speed should be 500 revolutions per minute; 36 inch pulleys, 420 turns; 42 inch pulleys, 325 turns; 48 inch pulleys, 300 turns. This list, he says, saves the trouble of working out the periphery speed, for the speed of the machine is determined by the size of the saw pulleys.

NEW SAW MILL AT ST. JOHN.

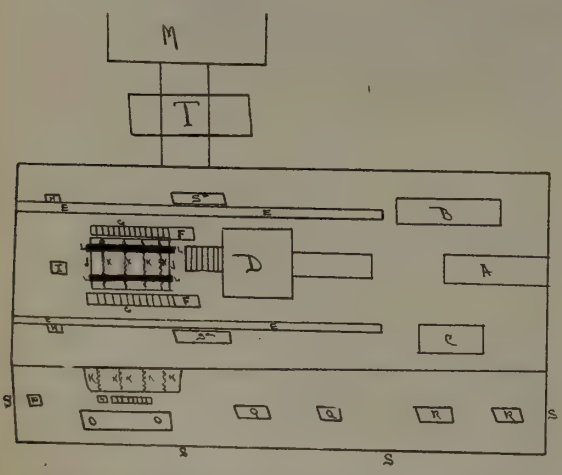
The destruction by fire last year of the saw mill of Murray & Gregory at St. John, N.B., while considered at the time a great misfortune, was soon forgotton in the great interest taken in the rebuilding of the plant, and there has now been completed a larger and more modern mill, and one in which the waste of lumber is reduced to the minimum. The

MURRAY & GREGORY'S MILL, ST. JOHN, N.B.

equipment includes resaws and edgers which did not form a part of the equipment of the old mill. The edgings are automatically handled, and there is a very convenient system of removing the sawdust, rubbish, etc. Altogether the mill is very economically and conveniently arranged.

The capacity of the mill per day of nine hours is 75,000 feet of long lumber, 25,000 shingles, 6,000 to 8,000 pieces clapboards, 40,000 pieces laths, and 25,000 staves and headings. The dimensions are 160 x 64 feet.

In the accompanying diagram showing the lay-out of the mill, A represents the steam nigger; B, rotary; C, double clapboard machine; D, stock gang; E, deal runs; F, edgers; G, runs from edgers; H, trimmers; I, heading splitter; J, opening in floor, three feet deep, in which run chains to carry away edgings; K, chains; L, bridges across opening; N, boiler house; M, cutter for lath lengths; O, lath machine; P, heading machines; Q, stave machines; R, shingle machines; S, wing to building, the floor of which (containing shingle machines, lath machines, etc.) is about 8 feet lower than that upon which stand the stock gang, rotary, etc.; Sa, resaws; T, engine room.



PLAN OF MURRAY & GREGORY'S MILL, ST. JOHN, N.B.

The stock gang, resaws, edgers, etc., were supplied by the St. John Iron Works, St. John, N.B.; the boilers and engines by James Fleming & Company, St. John, N.B.; the shingle and clapboard machines by Alex. Dunbar & Sons, Woodstock, N.B.

THE NANAIMO SAW MILL.

The saw mill of Andrew Haslam at Nanaimo, B. C., was one of the first mills established on Vancouver Island. The mill was established in 1885 by the Royal City Lumber Company, of New Westminster, Mr. Haslam being a shareholder in the company, and manager of the Nanaimo mill. Operations were commenced in a very small way, the business being devoted exclusively to the sawing of rough lumber up to the year 1887, when Mr. Haslam, in conjunction with Mr. A. E. Lees, purchased the property, the partnership heralding the expansion of the business and the manufacture of all kinds of lumber. In 1889 Mr. Haslam secured full control of the business, and at once began extensive improvements and a large expansion in the amount of business done. A large sash and door factory was built and fitted with four up-to-date planers and stickers. One of the best equipped dry kilns in the province was also installed.

Prosperous in business and with "Excelsior" as his motto, Mr. Haslam determined in 1899 to make further improvements. A new mill was constructed on the water front of Nanaimo Bay, the old mill dismantled and all the machinery, together with a number of new machines, and the various accessories of a first class plant, were installed in the new mill. The sash and door factory was greatly enlarged, and a large shingle mill, equipped with three machines, manufactured by Shaake, of New Westminster, was added to the plant.

Although for years the mill has been engaged in the manufacture of cedar, fir and spruce, to-day the chief product is cedar, Mr. Haslam having carefully reserved his splendid timber limits for that purpose. These limits are the envy of the various lumber dealers along the Coast and comprise 13 000 acres of the best timber on the Continent, a conservative estimate by the owner placing them at 350 million feet, of which 100 million is cedar. Half of them are situated on the mainland at Theodosia Arm, Haslam Lake and Jervis Inlet, and the other half on the Island at Discovery Passage, all of them being close to shore and easily accessible.

The mill is driven by eight powerful steam engines of 350 horse power, and five boilers, an uncommon feature in the working being seen in the fact that each machine is driven by a separate engine. At present the mill employs about 100 hands, and has a capacity of 60,000 feet of lumber and 60,000 shingles per day of 10 hours.

Mr. Haslam, besides being in active business management of the saw mill, has twice served as Mayor of Nanaimo, and was elected by acclamation to the Dominion House in 1893. He is one of the most popular citizens of the Island.

NOTE.—Since the above was written we regret to learn that Mr. Haslam's mill has been completely destroyed by fire, entailing a loss over $100,000.

SAW AND PLANING MILLS OF A HASLAM, NANAIMO, B. C., RECENTLY DESTROYED BY FIRE.

PERSONAL.

Mr. Jacob Hazleton, a well known lumberman of Fredericton, recently returned from a trip around the world.

Hon. Peter White, of the Pembroke Lumber Company, Pembroke, Ont., whose health has been impaired of late, has gone to Atlantic City, N.J., in hope of recuperating.

Mr. J. B. Miller, president of the Parry Sound Lumber Company, Toronto, returned early in May from a visit to Great Britian and the Continent, on business and pleasure combined.

Mr. Harry O'Connor, of Winnipeg, has been given in addition to his other duties, the supervision of all matters affecting the lumbering interests in the West so far as the Canadian Pacific Railway are concerned.

Mr. Byrad Warnock has succeeded Mr. F. A. Hayhurst as manager of James Warnock & Company, manufacturers of edge tools, etc., Galt, Ont. Mr. Warnock is a son of the late James Warnock, the founder of the business. Mr. Hayhurst has been appointed manager of the Galt Art Metal Company.

Mr. C.P. Eastman, of Petitcodiac, N.B., has been appointed, by the Dominion Government, commissioner of forestry and forest exhibits for New Brunswick at the Louisiana Purchase Exposition. Mr. Eastman has been connected with the lumbering business for many years.

A welcome visitor to the office of the CANADA LUMBERMAN about a week ago was Mr. A. A. Scott, manufacturer of hardwood lumber and cooperage stock, McGregor, Ont. Mr. Scott speaks hopefully of the outlook for both lumber and cooperage material. He returned early in May from Cincinatti, Ohio, where he attended the annual meeting of the National Slack Cooperage Manufacturers' Association and was appointed a member of the committee on specifications and grades.

QUEBEC LIMIT HOLDERS' ASSOCIATION.

The annual meeting of the Province of Quebec Limit Holders' Association was held at the Chateau Frontenac, Quebec, April 29th, at which members from all parts of the province were present.

The constitution, annual report and financial statement were read and adopted unanimously.

The election of officers for the coming year resulted as follows:—President, Hon. Senator Edwards, of the W. C. Edwards Company, Rockland, Ont.; Vice-Presidents, F. P. Buck, Royal Paper Mills Co., Sherbrooke, P.Q., and Wm. Price, of Price Brothers & Co., Quebec. Executive Committee—Rod Tourville, (Tourville Lumber Co.), Montreal; Alexander McLaurin, (The Charlemagne & Lac Oureau Lumber Co.), Montreal; Wm. Power, M. P., Quebec; H. M. Durant, (St. Gabriel Lumber Co.), St. Gabriel de Brandon, P.Q.; Archibald Fraser, (Donald Fraser & Co.), Cabano, P.Q.; J. W. Brankley, (The Estate Frank Dudley), Agnes, P. Q.; F. F. Farmer, Three Rivers, P. Q.; E. A. Dubuc, (Chicoutimi Pulp Co.), Chicoutimi, P. Q.; John Champoux, (The Chaleurs Bay Mills Co.), Disraeli, P.Q.; H.K. Egan, (Hawkesbury Lumber Co.), Ottawa.

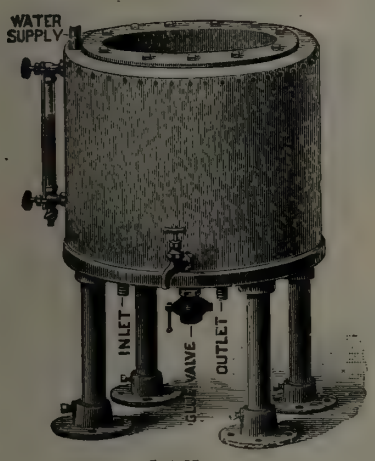
Mr. P. G. Owen was re-elected Secretary-Treasurer.

A vote of thanks to the retiring President was proposed by Mr. H. M. Price, seconded by Hon. Senator Edwards, in very complimentary terms, congratulating him on having been instrumental in organizing the association and on the result of the past year's work.

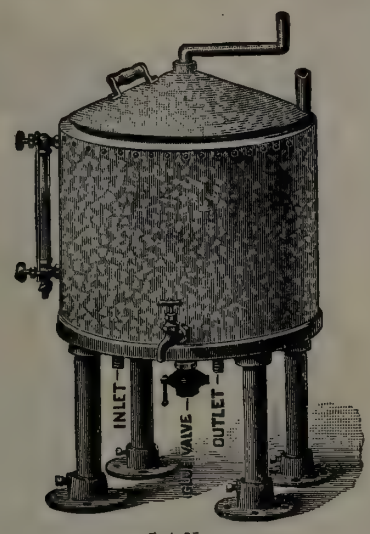
Mr. Tourville replied, thanking the members for the assistance they had given him, and he remarked that in leaving the presidency he would not be deprived of the power to work for the association, the good success of which he had so much at heart, as he remained still by virtue of his former office a member of the Executive Committee.

IMPROVED APPLIANCES FOR

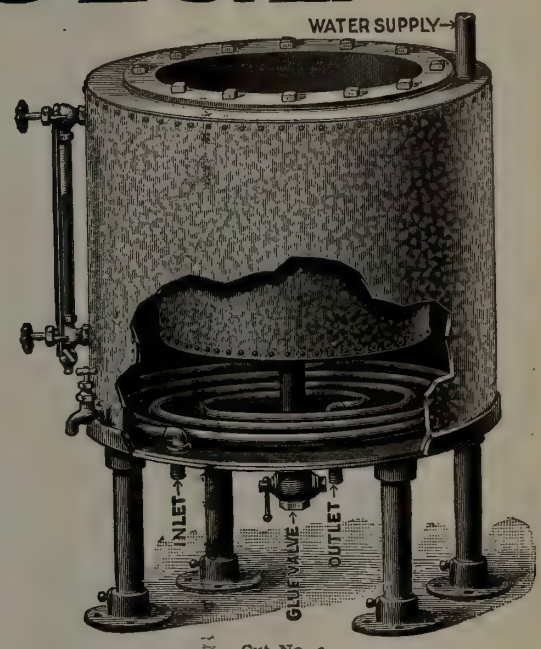
HANDLING GLUE



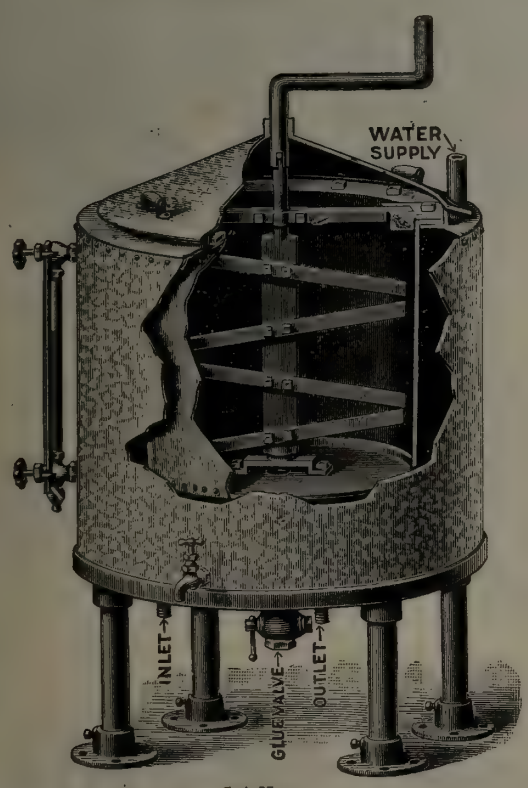
Cut No. 1.
No. 61 BOILER.



Cut No. 2.
No. 61 BOILER.
With heavy galvanized iron lid, fitted up complete with Glue Stirrer.



Cut No. 3.



Cut No. 4.

STEEL GLUE BOILERS OR COOKERS (Galvanized)

Cut No. 1, 6 gallon Steel Glue Boiler, and cut No. 2, same Boiler with Heavy Galvanized Iron Cover and arranged with Glue Stirrer. Cut No. 3, a 20 gallon Boiler or Cooker, No. 63, giving a sectional view, showing arrangement of Copper Tube Coil for heating the water.

Cut No. 4 shows a No. 63 (20 gallon) Boiler or Cooker with Heavy Galvanized Iron Cover and sectional view showing arrangement of Glue Stirrer.

Made of Heavy Sheet Steel, both Water Jacket and Glue Pot well Galvanized. The Steam Pipes are connected to a Coil of Heavy Copper Tubing; in this manner the water is quickly heated and the steam can be piped back through trap to steam boiler, thus causing very little loss of steam and overcoming all danger of bursting the Glue Boiler, as all steam pressure is confined to the Copper Tubing. Other features are fully described in our catalogue of **Modern Glue Room Appliances.** If interested,

NEW YORK, 136 Liberty Street

THE Wood-Worker and Retailer

LABOR SAVERS.

D. M. ROBINS in the Wood-Worker.

There are many little devices which may be employed around the machine room to save time and handling of material. A device which I have successfully used is for the band saw. I know of a porch column factory where thousands of Colonial colnmns are turned out in a year, and the caps and base blocks are sawed by hand, after being marked out with a compass in the way that was used long years ago. I herewith show you how to make an attachment for the band saw which will cut out circular stuff of this nature, any diameter which can be handled easily, without previous marking, and saw it so accurately that with a compass you cannot detect a variation from the true circle.

Take a piece of board the size of the saw table outside the saw, that is of a width equal

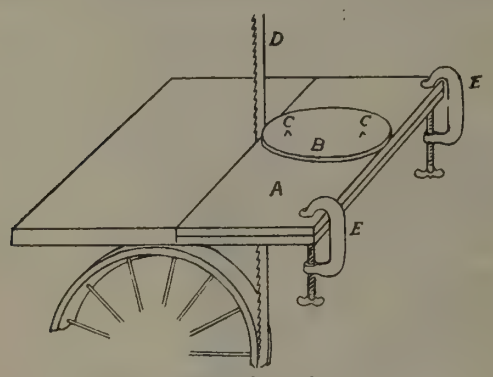

FIG. 1—BAND SAW DEVICE.

to that from the saw blade out to the edge of the table, and of a length equal to the table from front to back. This is a base. Suppose you want to saw out circular caps or base blocks for columns 12 inches diameter and 1½ inches thick. The radius of the cap is 6 inches, so 6 inches in from the saw, on the base board, put a wooden ½-inch dowel into the base and let it stick up about an inch. Now cut another circular "form" of inch stuff and of same diameter as the caps you are to saw out (a circular form must be made for each size circle you want to cut), put a hole in the centre of it, to revolve freely on the dowel pin in the base board, put a couple of short, sharpened spurs into the top of the circular plate to hold the material in place, clamp the base board to the table so that the dowel pin comes exactly opposite the teeth of the saw, cut off the material in square pieces on the cut-off saw, put one on the "plate," tap it with a hammer so it will not slip from the spurs, then swing it around to the left against the saw and it will be cut smoothly and quickly—no marking out with a compass, no stooping over the machine to see the lines. It can also be operated with the eyes shut, as there are no lines to follow, and every piece will be cut accurately and of exactly the same diameter. A is the base board. B is the circular form, which revolves freely on the dowel pin set in the base board. C C are the spurs to hold the work in place on the form. D is the band saw. E E are the clamps holding the attachment to

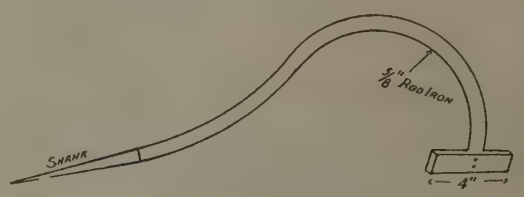

FIG. 2—TOOL-HOLDER FRAME.

the table. The whole may be removed intact when not in use.

Another attachment is for making straight turnings on the lathe, such as bed rolls or any nature of straight work which is not too long to remain stiff between the centres without springing, and ot a large enough diameter to maintain its rigidity.

Suppose we want to make bed rolls about 3 feet long and 4 inches in diameter, of soft wood, for veneering. The stock should be roughed off first by hand, leaving it about ¼ inch larger than finish size. It is well understood that work of this nature must be absolutely smooth and perfectly straight, in order that the veneering may set close and have no humps or wrinkles in it. It is perhaps as particular a piece of work as ever comes into the hands of the wood-turner.

Having roughed off the stock, set the rest as close to the work as possible, having it per-

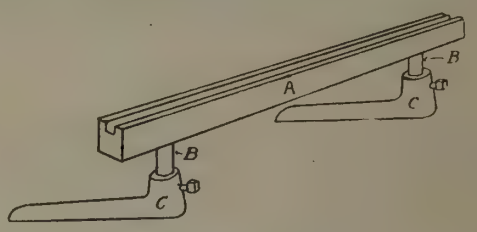

FIG. 3—HARDWOOD REST.

fectly level from one end to the other and no higher than the two lathe centers.

Now, having adjusted the piece correctly in the lathe and with the rest in correct position, I will explain the automatic device for turning the roll absolutely smooth and straight. The attachments are easily made, consisting of a caliper-like frame, which is made of a ⅝-inch bolt about 20 inches long, with the crosspiece riveted on the outer end—see Fig. 2.

We must next make a back rest of hardwood, or rather a back guide, as long as the pieces we are working, and it must be set exactly as high as the front chisel rest and exactly parallel to it. Fig. 3 shows how to make the rest or guide from the back of the lathe. A is a wooden guide a little longer than the roll we are turning, so it will project over the work at each end. It is about 2 inches thick by 3 inches wide, and has a groove the whole length of the top, about ½-inch deep and of the same width as the iron we riveted on the bent rod in Fig. 3. B B are wooden pins, turned the right size to fit into the lathe sockets C C.

Now we will give the reader a clearer conception of our appliance by putting our different pieces together and placing them on the lathe ready for service. A represents the roll hanging between the lathe centers, ready for finishing. B is the hardwood track or guide to

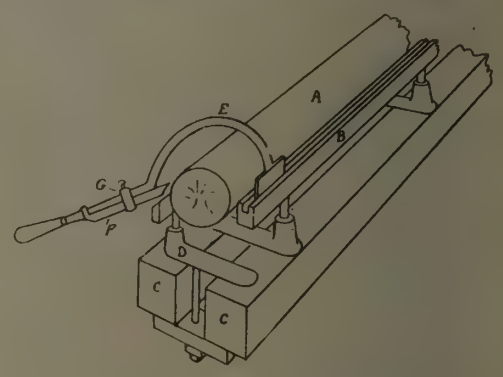

FIG. 4—COMPLETE ATTACHMENT.

carry the turning instrument. C C is the bed frame of the lathe. D is the front rest and sockets. E is the smoothing attachment. F is an ordinary wood-turner's 2-inch gauge, held in place by the collar and set-screw. It will readily be seen that the instrument is intended to travel lengthwise the work, bearing solidly upon the front rest and back guide. The proper adjustment of all the parts must necessarily make every roll perfectly smooth and straight and of an equal diameter. Tapered work may just as readily be turned out by setting either end of the back guide in such a position as will give the desired diameter at each end of the roll.

This appliance may be used with equal efficiency on small work or large work, even up to 8-foot columns, but the weight and strength of the instruments, guides, etc., must be in keeping with the work it is designed to accomplish.

The Rat Portage Lumber Company are installing new machinery in their saw mill at Vancouver, B.C., including a new band mill and two carriages. The work of rebuilding the mills of the company at Harrison River, B.C., is being proceeded with.

C. P. R. THE COMBINE.

The following letter from a gentleman whose nationality accounts for its peculiar construction was received by Mr. Isaac Cockburn, Secretary of the Western Retail Lumbermen's Association, Winnipeg. The retailers who have suffered through delay in receiving shipments by the C. P. R. will appreciate the sentiments :

WAUCHOPE, Assa., 2 May, 1904.

ISAAC COCKBURN :

Dear Sir,—Will you be good enongh to let me know if I can not make any claim again the C. P. R. for car of lumber shipped from Sapperton, B. C., which more one month and not delivery here yet, also one other car No. 44582 shipped the 15 April from Brandon and not received yet. I want to know if the C. P. R. can make what he want with the dealer of lumber as the people are anxious for to have lumber but the C. P. R. has no time for carried our lumber but she has time for write in the papers of the country that we have one combine on lumber but I think she is the C. P. R. that she has the want combine on the country.

(Sgd) MAURICE QUENNETTE.

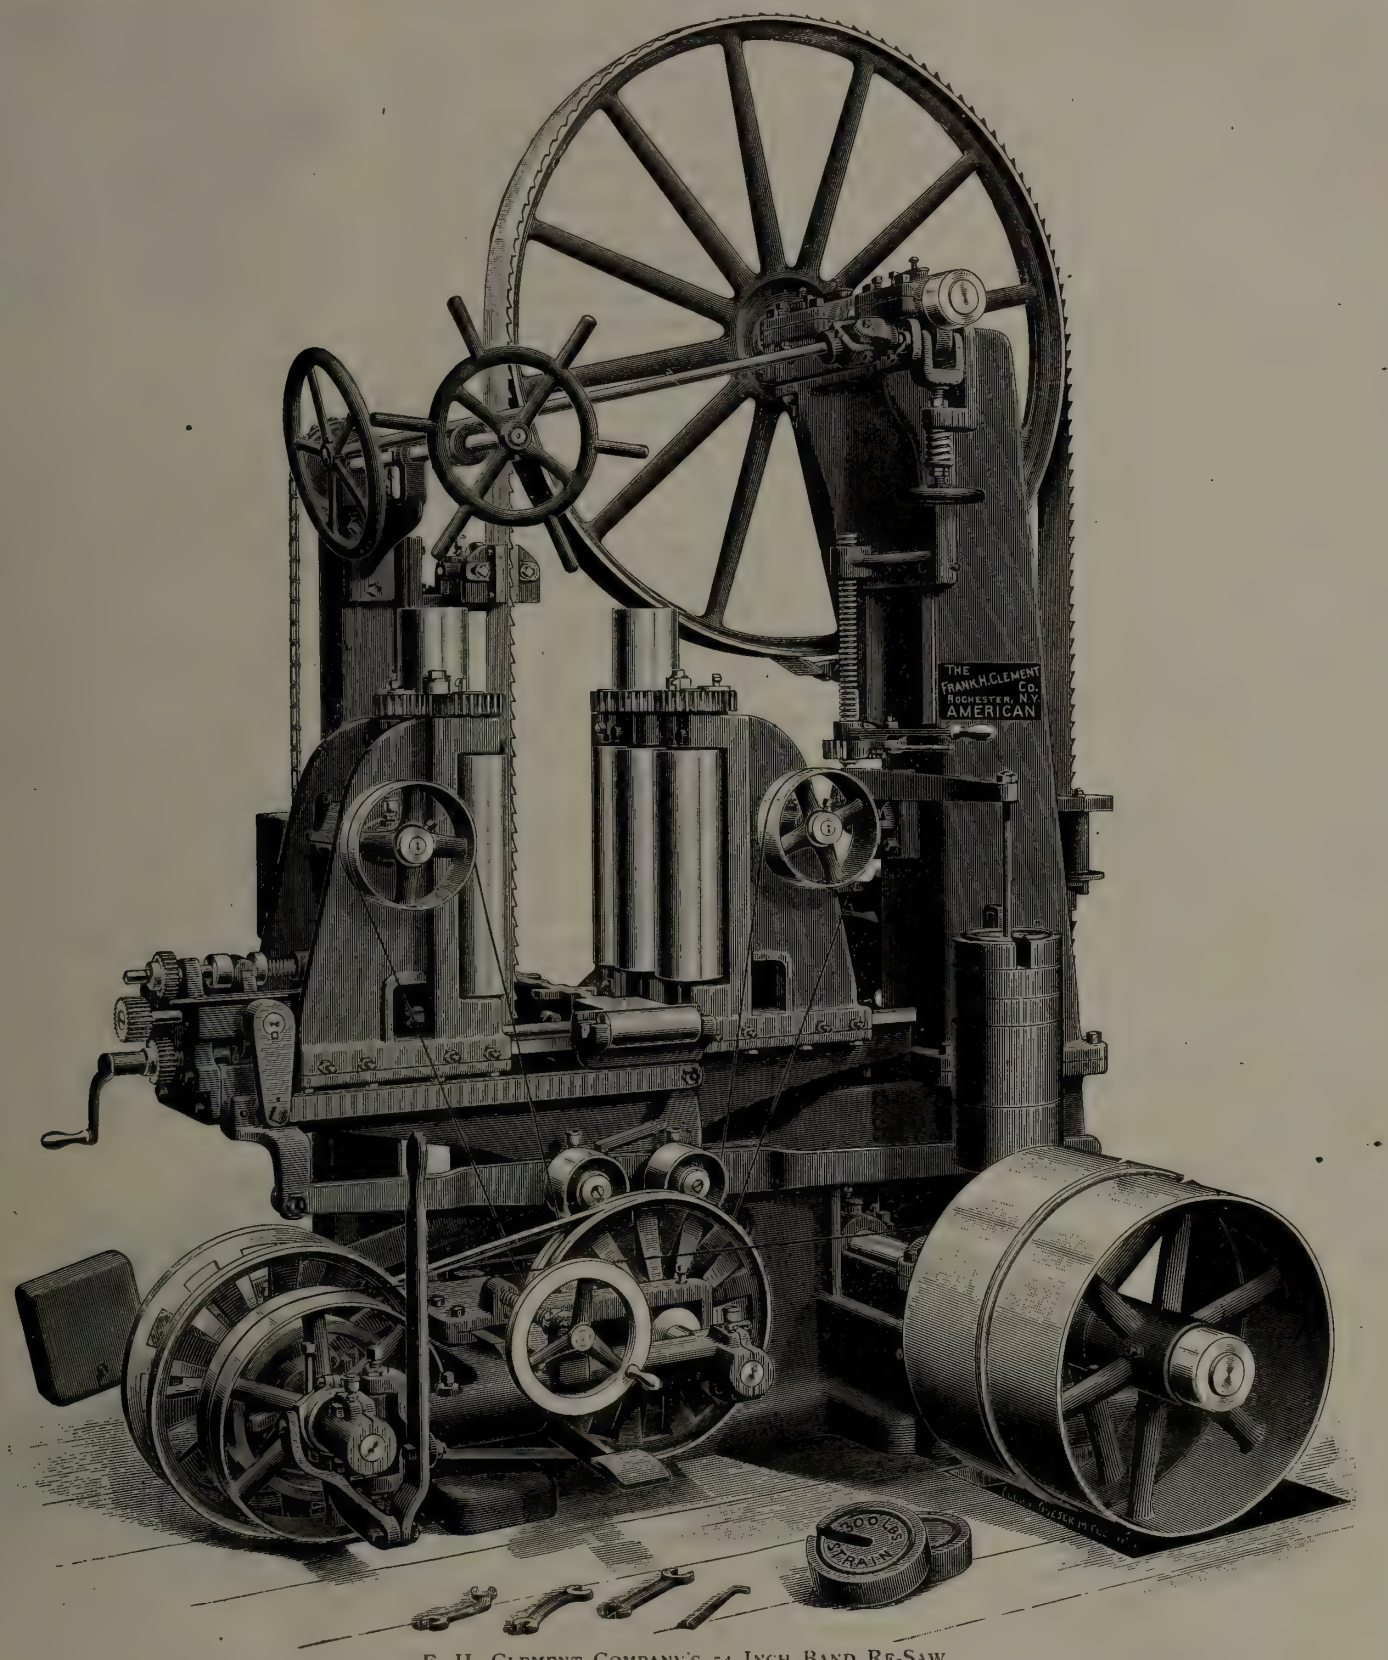
F. H. CLEMENT COMPANY'S 54 INCH BAND RE-SAW.

The accompanying cut illustrates a late improved machine built by the American Wood-Working Machinery Company. It embodies all the conveniences and attachments that are necessary or desirable for any kind of re-sawing on hard or soft wood and is amply powerful both on the blade and feed works for any reasonable demand. The frame is strong, heavy, has a broad base and if properly set up will not vibrate, even when running on a light floor. The shafts are large in diameter and have bearings from 9 to 14 inches long, running in self oiling boxes. The lower wheel is a solid web and very heavy. The upper one is as light as is consistent with strength.

The feed works are very powerful, there being six feed rolls, and the feed varies from 12 to 120 feet per minute, by adjusting the expansion cones, giving any variation of feed desired, according to the work required. The right hand rolls are rigid in their boxes but the left hand set are elastic so as to grasp uneven stock and hold it firmly against the rigid roll, thus making a powerful feed even on very unequally sawed lumber. All rolls are adjustable to the blade and wheels in case of wear. With the self-centering attachment both sets of rolls are held rigid and the adjustment for thickness is made by lower screw and hand crank.

The capacity of the machine is 30 inches vertically and from ⅛ to 20 inches horizontally; slabbing from 12 inches wide; will split a 16 inch timber in the center and will cut a veneer from 12 inch timber.

For prices on the above or any other wood-working machinery, address nearest salesroom, American Wood-Working Machinery Co., 136 Liberty St., New York City, or The Fairbanks Company, Vancouver, B. C.



F. H. CLEMENT COMPANY'S 54 INCH BAND RE-SAW.

—The lumber business which has for many years been conducted by Mr. Michael Adolphe Grandbois at St. Casimir, Que., will in future be conducted by his two sons, Lewis Phillip H. Grandbois and Henry Grandbois, under the title of "M. A. Grandbois." The present proprietors have been connected with the business for some time, and have a thorough knowledge of the requirements.

MEETING OF COOPERAGE STOCK MANUFACTURERS.

The sixth annual meeting of the National Slack Cooperage Manufacturers' Association was held in Cincinnati, Ohio, May 3 and 4. It was a representative meeting, the Canadian members present being A.A. Scott, McGregor, Ont.; Neil Watson, Mull, Ont.; W. C. West, Sutherland-Innes Company, Chatham, Ont.; and R. L. Merritt, Blenheim, Ont.

The presidential address emphasized the necessity of careful grading of stock. There had been a tendency to be careless about putting up stock according to standard grading. This was started during the rush when coopers were willing to take anything and everything in order to secure prompt shipment. He hoped that all men engaged in the business would keep to the standard grading rules. The secretary announced that forty new members had joined the association during the year, and he anticipated a still greater increase during the coming year. The present membership is 160. The following committee on specifications and grades was appointed: W.K. Jackson, chairman, Tindle & Jackson, Buffalo; J.M. Kelton, Standard Hoop Company, West Bay City, Mich.; A.A. Scott, McGregor, Ont.

In considering the question of future demand and the production of stock for the present year much information was brought forth. To sum up, the production will be about the same as the past year, and there is no reason why the demand should not continue at least as good as it is now.

Wire hoops as a factor in the demand were the subject of discussion. It was announced that 35,000,000 wire hoops were sold last year. The sales were said to be double those of 1902 and the wire hoop men expect 1904 to show even greater figures. Wire, according to one member's estimate, is cheaper than wood hoops, probably $2.25 per thousand, and there is no question about it being used successfully in the larger shops where they have machinery to drive them with, but in the smaller shops wire is proving disappointing, according to the sentiment expressed. It was shown that, were it not for the wire, the manufacturers of wooden hoops would be unable to supply the demand.

The committee on grades presented the following specifications:

STAVES.

Elm staves 30 inches long shall be cut not less than 5 staves to 1 15-16 inches in thickness, elm staves 24 to 28 inches long shall be cut not less than 5 staves to 1 7-8 inches in thickness except 24 inch or keg staves specially cut, when said staves shall be cut 6 staves to 2 inches in thickness.

Cottonwood staves of all lengths shall not be less than 5 staves to 2 inches in thickness.

No 1 staves shall be of full thickness and uniform throughout, free of knots, slanting shakes, doxy wood and other defects.

Meal barrel staves shall be free of slanting shakes over 1½ inches long, knot holes, unsound knots (but sound knots of not over ¾ inch in diameter shall be allowed) free of thin staves and shall consist of good sound workable staves.

No. 2 staves shall be free from dead culls. Dead culls are staves containing knot holes of over ½ inch in diameter, staves with large coarse knots or badly cross-grained near quarter that prevent staves being tressed in barrels, and staves under ¼ inch in thickness; staves with bad slanting shake exceeding 6 inches in length, and with rot that impairs the strength.

Mill-run staves shall consist of the run of the knife, made from regular run of stave logs, dead culls thrown out.

SPECIAL STOCK.

White ash staves shall be cut 5 staves to 2⅛ inches in thickness, graded the same as elm, but only No. 1 and No. 2 quality.

Mill-run elm or hardwood apple barrel staves shall be cut 6 staves to 2 inches in thickness, and shall consist of the run of the mill, from the regular run of stave logs, dead culls thrown out.

Mill-run cottonwood apple barrel staves shall be cut 5 staves to 2 inches in thickness.

All the above staves shall average in measurement 4 inches per stave or 4,000 inches per 1,000 staves across the bilge, with the exception of the keg staves, which shall measure 160 inches per bundle of 50 staves, across the bilge, and 24 inches half-barrel staves, which, when not otherwise specified, shall measure 3½ inches wide or 175 inches per bundle across the bilge. All other staves not specifically mentioned shall be sold according to the local custom or under special agreement.

HOOPS.

Sugar barrel hoops shall be 6 feet 4 inches, 6 feet 6 inches and 6 feet 9 inches long, cut so as to be not less than 5-16 inch to 3-16 inch in thickness, when finished in season, and not less than 1⅜ inches wide when seasoned.

Flour barrel hoops shall be 5½ ft. and 6 ft. long and shall measure, when seasoned, not less than 5-16 in. to 3-16 in. in thickness and not less than 1⅜ in. wide.

Keg hoops shall be sold on special specifications as agreed upon between buyer and seller.

No. 1 hoops shall be good, sound timber, fully up to specifications, free from broken hoops in the coils and well finished. See that they come fully up to the grade.

HEADING.

No. 1 basswood or cottonwood heading shall be made from good, sound timber, free from damaging defects, of such diameter as is required, well jointed, ½ inch in thickness and thoroughly kiln-dried.

No. 1 hardwood heading shall be of the same specifications as above, but only 7-16 inch in thickness and thoroughly kiln-dried.

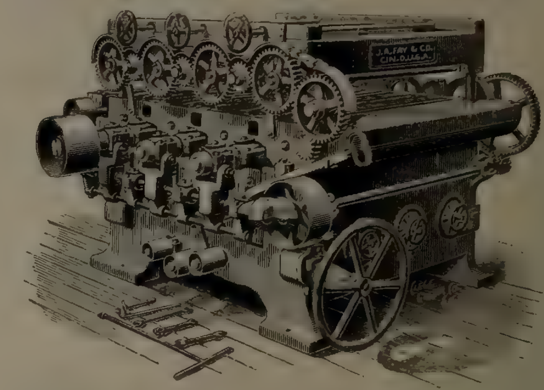
Mill-run heading shall be the run of the mill, dead culls out, thickness and dryness the same as No. 1.

No. 2 heading shall be the heading thrown out of the No. 1, dead culls out. All staves, hoops and heading not specifically mentioned shall be bought and sold on terms and specifications agreed upon between buyer and seller.

IMPROVED SANDING MACHINE.

The cut here represented is of a sanding machine especially designed for makers of wagon, carriage, furniture and piano material. It was patented March 20th, 1900, and has embodied in its make-up new points to insure it doing good work to those having this class of sanding to do. Limited space enables of only some of the most important features being considered.

The machine is invaluable where a perfectly smooth surface is desired, either for varnishing or painting. This is attested by many testimonial letters from those who are now using this machine. It is massive and



No. 4 Triple-Drum Sander.

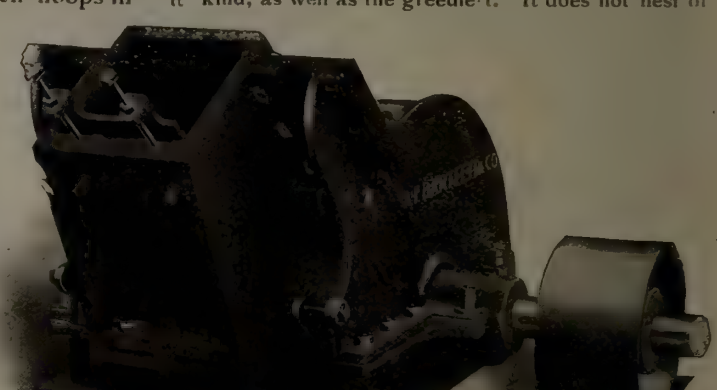
substantial, and saves the work of several machines for doing this character of work. The three steel polishing cylinders upon which the paper is placed have a vibratory motion to prevent the formation of lines, and are equipped with a device for quickly applying the same paper and giving it the proper tension. Each cylinder carries a different grade of paper, the third cylinder giving the final and smoother finish.

The feed is very powerful, and consists of eight feed rolls, four above and four below, driven by a train of heavy expansion gearing, and will open to receive material eight inches thick. The machine is made to work material from 30 to 80 inches wide, and has a brush attachment which cleans the stock after it has passed through the machine. The pressure rolls are so arranged that the adjustments can be made easily, quickly and accurately, and the feed started and stopped instantly.

The makers of this improved sander, J. A. Fay & Egan Company, Front Street, Cincinnati, Ohio, will be glad to hear from those interested, to whom they will submit prices, information and cuts showing it in detail. They will also send free their new illustrated catalogue showing their machinery to those who will write mentioning this paper.

IMPROVED BARTLETT SAW MILL HOG.

The accompanying is an illustration of the improve Bartlett saw mill hog, or edging grinder, which has be d making a reputation for itself as one of the busiesten it kind, as well as the greedie t. It does not hesi of



Improved Bartlett Saw Mill Hog.

to tackle anything that comes its way, and has been known to come out of encounters with old axes, railroad spikes, and even crowbars, with only slight, and never more than temporary, damage to its digestive apparatus. The manufacturers, A. F. Bartlett & Company, Saginaw, Mich., have built up a fine trade in this machine. Since commencing its manufacture they have made many improvements, having stiffened and strengthened the machine wherever it presented any appearance of weakness whatsoever, and to-day, with proper usage, it is claimed to be absolutely unbreakable. A card to their address will bring circulars and prices by return mail.

THE NEWS

—Messrs. Clegg are building a planing mill at Mitchell, Ont.

—Coward & Sons are installing a planing mill plant at Fernie, B.C.

—J. J. White has sold his planing mill at Wheatley, Ont., to R. Iverson.

—Charles Pedwell has just completed a new saw mill at Lion's Head, Ont.

—J. A. Cusson is building a large sash and door factory at St. Boniface, Man.

—A new edger has been installed in the saw mill of Babiet & Sons at Gibson, N.B.

—Leverington & Didemus have their new planing mill at Niagara Falls South, Ont., in operation.

—Brown & Rutherford, Winnipeg, Man., are installing a new engine in their planing mills.

—The Pearce Company, Limited, Marmora, Ont., are building a large kiln in which to burn their sawdust.

—Bentley & Humberstone, planing mill owners, Medicine Hat, N.W.T., have been succeeded by Luno & Wilson.

—W. S. Montgomery, of Dalhousie, N. B., has recently sold out his lumber business at that place to Berminger & Chapin.

—Fletcher & Ross are renovating the saw mill at Cherry River, Que., which they recently purchased from Manson, Boright & Buzell.

—The improvements which Lemon, Gonnason & Company are making to their sash and door factory at Vancouver, B.C., will cost upwards of $20,000.

—The Galetta Cooperage Company, Galetta, Ont., have asked for a special rate of assessment on their new stave factory for a period of ten years.

—John Cooper, of Tupperville, Ont., has installed a 60 horse-power engine in his saw and stave mill. It was supplied by Lee Bros., of Wallaceburg.

—T. O. Anderson, late of the Anderson Furniture Company, Woodstock, Ont., has commenced the erection of a large furniture factory at Newcastle, N.B.

The Rothesay Lumber Comyany, Limited, capital $10,000, and the Manitoba Lumber Company, capital $100,000, have been incoporated by the British Columbia Government.

—When the addition now being built to Cushing Bros., sash & door factory at Calgary, N.W.T., is completed, the capacity will be 1,000 doors per day, besides sash, frames, etc.

—The Oxford Mountain Railway is being extended to Mansonville, Que., where several parties are considering the advantages offered by that place for the manufacture of hardwood products.

—A sawmill with a daily capacity of 20,000 ft. is being built at Chilliwack, B.C., by Charles Tapp. It is being equipped with modern machinery, which will include a 4-ton double surfacer for producing dressed material.

—Three Spokane capitalists, Messrs. Grady, Owman, and Carloon, purpose building a saw mill at Morrissey Junction, B. C. They intend moving their machinery from a mill which they have been operating in Montana.

—The North River Lumber Company, of St. Ann's, N.S., took out large quantities of pulp wood and saw logs last winter, and their business is proving a boon to Victoria county. The manager is F. J. D. Barnjum.

—The new mill of the Rainy River Lumber Company at Rainy River, Ont., has been completed. It is one of the most up-to-date plants in Canada, has a capacity of about 400,000 feet per day, and will employ 600 men.

—The St. Paul & Tacoma Lumber Company have the record of cutting more lumber in one year than any other company on the coast and furnish more freight to the Northern Pacific Railroad than any of their patrons.

—The E. K. Wood Lumber Company has been registered as an extra-provincial company in British Columbia, with office in Vancouver, D. G. Marshall being the local attorney for the company. The head office is in San Francisco.

—The Madawaska Lumber & Milling Company, Limited, has been incorporated, with a capital of $20,000 and headquarters at Clair Station, N.B. The promotors are Thomas Clair, Joseph Tong, Mathias Nadeau, James Clair and Richard Clair.

—Hogan Bros., of Savanne, Ont., have entered suit against A. R. Mann for cutting timber from berth No. 6, situated south of Lac des Milles Lacs. They claim that he cut about 80,000 jackpine ties off the berth, and want an injunction to prevent him from selling them.

The Tonstown Lumber Company, Limited, has been incorporated, with a capital of $10,000. The head office of the company is in the township of Ingram, Nipissing district, and the directors include Francis J. Allan, of Perth, and Robert Allan, of Township of Palmerston, both lumbermen.

—The City Council of New Westminster, B.C., will grant a lease of certain water lots to J. Moore, of Vancouver, on which to build a saw mill. The lease as drawn up provides that all the men employed shall be whites, that the mill shall be capable of cutting 75,000 feet of lumber per day, and that work shall be commenced within six months and be completed in a year.

—The Kamloops Lumber Company, Limited, has been incorporated by the Dominion Government, with a capital of $500,000, the head office to be in Toronto. The incorporators are William Irwin, Peterboro; George McCormick, M.P., G. W. Fowler, M.P.; Hon. G. E. Stephenson, Detroit; Leiut.-Col. J. I. Davidson, Lieut.-Col. J. A. McGillivray and Hon. Geo. E. Foster, Toronto. The operations of the company will be carried on in British Columbia.

—J. P. McGoldrick, of Minneapolis, Minn., purposes building a large saw mill at Nelson, B.C., to be operated as the Nelson Lumber Company, with a capital of $300,000. The mill will be equipped with a double cutting band saw and will have a capacity of 100,000 feet of lumber in twelve hours. It is understood that plans for the mill have been drawn by C. W. Willett, consulting engineer for Clark Bros., manufacturers of saw mill machinery, Seattle, Wash.

—Lumbering in the Kootenay district of British Columbia is very active and the supply of logs secured insures a large cut this year. The North Star Lumber Company are making about $10,000 worth of improvements to their mill, which will give a capacity of 50,000 feet per day. The East Kootenay Lumber Company have added new machinery to their Cranbrook and Ryan plants, and the Standard Lumber Company, at Mayook, have their mill in good shape and sawing steadily. It is said that Otis Staples, of Stillwater, Minn., is arranging to build a large mill on the St. Mary's river near Cranbrook.

DO YOU LACK STEAM?

No matter how good the machinery in a mill, it cannot turn out the maximum amount of work unless there is ample power to drive it at all times. When steam gets low, it affects the output of every machine in the entire mill. This being the case, it seems singular that there are those who will continue to run a mill day after day, week after week and month after month, with scarcely a day when they are not obliged to shut down occasionally to wait for steam to rise. Where this condition prevails, it is claimed that the efficiency of every machine in the entire mill can be increased by putting in the Gordon Hollow Blast Grate, thus adding from 20 to 50 per cent. to the power, without increasing the number of boilers or making any further change. As this grate, together with the necessary pipe and blower, is sold on approval, 30 days being given in which to thoroughly test it, and as it may be returned to the manufacturers at their expense in case it fails to give complete satistaction, there is no risk incident to installing it.

Those interested would do well to drop a line to the manufacturers, the Gordon Hollow Blast Grate Company, Greenville, Michigan, giving the number of boilers, the width of the furnaces or ovens and the length of the grates.

Good advertising is the path finder for all who seek success in business.

Westinghouse-Parsons steam turbines are to be installed in the new power station of the Union Metallic Cartridge Company at Bridgeport, Connecticut. The installation will consist of two turbo generating units, each of 500 kw. capacity. The two units will operate in parallel, and will furnish 440 volts, 3-phase current at 7200 alternations per minute for general power and lighting purposes in the various shops located within three or four blocks of the power station. The turbines will operate under 150 pounds steam, 28" vacuum, and possibly superheat.

CRAIG MINE CRYSTAL CORUNDUM WHEELS

Our Pure Crystal Corundum Saw Gummers have no equal for their rapid, cool, cutting properties.

Read the following from Bulletin 180 of the United States Geological Survey, which says:

"Often a distinction is made between emery and corundum, many persons not recognizing emery as a variety of corundum.

Emery is a mechanical admixture of corundum and magnetite or hematite. It is, of course, the presence of corundum in the emery that gives to it its abrasive qualities and makes it of commercial value, and the abrasive efficiency of emeries varies according to the percentage of corundum they contain."

Emery is imported, mined by Greeks and Turks and contains only about 25% corundum. Our Crystal Corundum is guaranteed to be 98% pure alumina, a Canadian product, mined and manufactured by Canadians for Canadians.

HART CORUNDUM WHEEL COMPANY, Limited, Hamilton, Ont, Can.

WOOD PULP DEPARTMENT

THE MARITIME SULPHITE PULP MILL PROPERTIES.

The pulp mill properties which originally belonged to the Maritime Sulphite Fibre Company, but which have recently passed into the hands of the Bank of Montreal, are too valuable to be permitted to remain idle, and as by a recent decree of the Court the Bank is now in full possession, it is quite probable that arrangements will be made which will result in the resumption of operations at an early date. It is understood that the properties are being offered at a very low figure, particularly when it is considered that the conditions which caused the closing down of the mills were largely the result of mismanagement and lack of proper executive administration. That the properties are very valuable is shown by the following brief description.

The mills are located at Chatham, New Brunswick, which point is on the line of the Canadian Eastern Railway, which connects with the Intercolonial Railway at Chatham Junction and with the Canadian Pacific Railway at Fredericton.

The main mill was erected during the years 1886-89, but various additions have since been made, including the erection of new towers. The mill started operations in June, 1889, and was closed down in September, 1901. The sulphite mill is built of brick and is in a good state of repair. The wood room is 156 x 48 feet and contains on the first floor one log chipper built in Austria, one Holyoke wood chipper, two wood splitters, two chip crushers, one spare crusher, one knott boring machine, one fan and line of pipe for blowing wood chips to chip bins on third floor of digester room, elevators, refuse wood crusher, and other smaller equipment. On the second floor of the wood room there are six cones for automatically sorting chips, with carriers for taking chips to fan on first floor, to be blown to chip bins on third floor of digester room, six new cones partially built, with necessary shafting, pulleys, Bertram turning lathe, circular ripping saw, etc.

GENERAL VIEW OF THE MARITIME SULPHITE FIBRE MILL AT CHATHAM, N. B.

The digester room is 84x82 feet, the equipment on the first floor including four patent brick-lined digesters of a capacity of three to four tons of dry pulp per day, built in Duisbury, Germany, also two digesters of a capacity of seven to eight tons dry pulp per cook, built at the Barrowfield Iron Works, Glasgow, and two of similar size built by the Manitowoc Iron Works, Manitowoc, Wis., in 1901, besides pulp wagons, screens, feed water pumps, etc. The second floor contains two circular acid tanks, three water tanks, with valves, piping, etc. The digesters are filled by opening slides in bottom of chip hoppers situated on floor above. On the third floor are eight chip bins or hoppers for the storage of wood chips to be used in the digester immediately underneath. The time taken in cooking averages from 12 to 14 hours. When cooked, the cover of the bottom neck is swung clear, and the pulp washed out into the pit opposite each digester.

The filter room is 71x69 feet, and besides the usual equipment contains a Corliss condensing engine of 175 h.p. for driving the machine room side of the mill. In the furnace room, which is 116x33 feet, there are ten pyrites burners and eight sulphur burners.

VIEW OF MIRAMICHI RIVER OPPOSITE CHATHAM, N. B.—MARITIME SULPHITE FIBRE MILL IN DISTANCE ON THE RIGHT.

The dimensions of the acid or chemical house are 71x69 feet, with annex 46x23 feet and cooling room 108x17 feet. The equipment includes water and acid pumps, acid tanks, cooler chests, etc.

In the machine room, which is 126x69, there are situated one Fourdrinier machine built by Rice, Barton & Fales, two cylinder machines built by the Bertram Company of Dundas, Ont., screens, dryers, presses, cyclinder moulds, back water pumps, etc.

The engine room is 82x28 feet, and contains one 500 h.p. Robb condensing engine, one 55 h.p. auxiliary engine for acid plant, one 40 h.p. Osborne-Killey electric light engine, one Edison dynamo, and necessary accessories. There are two boiler houses, No. 1 containing eight boilers of 100 h.p. each equipped with Jones automatic stokers, and attached to which there is a complete fuel economizer plant. No. 2 boiler house contains two 250 h.p. Galloway boilers, one 250 h.p. Lancashire boiler and one 75 h.p. Polson boiler.

The machine shop is 28x48 feet, completely equipped; air compressor room 26x16 feet; sulphur shed 74x34 feet; pump house 19x16 feet. The old towers, of which there are six, contain one sprinkler, two acid tanks and two water tanks, while the new towers, over 100 feet high, contain three water tanks, four lime-

FOR THE CAMP

We have a very suitable lot of goods for camp supplies. We make this kind of trade a specialty. You who are not getting suited just as well as you would like, try us for your next order, and give us a chance to demonstrate our ability to give you satisfaction in this very important department of your business.

H. P. ECKARDT & CO.

Wholesale Grocers TORONTO

stone tanks, and one elevator for hoisting limestone. The warehouse and offices are 78x109 feet, store room 49x29 feet, and blacksmith shop 86x29 feet.

The barking mill is built partly of brick and partly of wood and is situated at a distance of 670 yards from the sulphite mill, with which it is connected by a railway track, the bark wood being conveyed to the sulphite mill by a steam locomotive and cars belonging to the estate. There is very extensive piling grounds at the barking mill, through which the Canada Eastern Railway have run sidings for the convenience of unloading pulp wood and logs carried over their road or hauled from the boom on the Miramichi river. The barking mill contains seven automatic barkers and six hand barkers, besides one 150 h.p. steam engine, three boilers and brick furnace, six cut-off saws, eight small cars for carriage of barked wood, one donkey engine for piling logs, blower and dust collector, etc. It may be stated that the barking of the wood was not done by the original management to good advantage, the system being complicated and necessitating too much handling, and it is possible that when the mill is again put into operation a different arrangement for barking will be made.

There is in connection with the property a log boom on the Miramichi river large enough to hold with safety 2,500,000 feet of logs. These are taken from the boom by a patent haul-up, for which purpose there is a complete equipment.

The construction and equipment account shows that the cost of the plant was $711,727. About 25 per cent. of this amount, however, was spent in remodelling parts of the mill and equipping it with larger and more modern machinery. The present capacity of the mill is estimated to be from 450 to 500 tons of sulphite pulp per week.

The acid is made by the tower system, and both sulphur and pyrites can be burned. The Fibre Company made 100,000 gallons of 4.2 sulphurous acid per twenty-four hours, and, by the addition of two or more more sulphur burners, the quantity could be considerably increased. The cost of pyrites, which was obtained in Newfoundland, was $4.40 per ton, being $2.90 for the pyrites and $1.50 for the freight. The pyrites contained from 45 to 48 per cent. of sulphur. Limestone was obtained from Cape Breton at $1.62½ per ton of 2,240 lbs. delivered on their wharf.

The timber lands belonging to the property consist of 262 square miles, on which the exclusive right is held to cut the spruce and hemlock. The yearly rental payable to the Government of New Brunswick is $8 per square mile, also $1.25 per thousand superficial feet as stumpage dues on the logs cut. The leases under which the lands are held run for twenty-five years from 1st August, 1893. These lands alone are not the only source of timber supply, as wood cut on other lands can be purchased. The Maritime Sulphite Pulp Company purchased wood along the lines of the Canada Eastern and Intercolonial Railways at from $2.25 to $2.50 per cord, and the freights averaged from $1 to $1.50 per cord, according to distance. The river wood, usually logs 9 inches and under in diameter, cost from $4.75 to $5.50 per thousand superficial feet, and was got within a radius of from eight to twenty-five miles. The supply can be obtained by both rail and water, there being two raft boats, a steam tug, and two large barges for transporting the wood brought by river. The cost of material entering into the manufacture of the pulp is itemized as follows: Coal per ton, delivered at Chatham, $3.25 to $4; spruce wood, per cord, delivered, $3.50 to $4; poplar, $2 to $2.25; hemlock (per 1,000 feet) $3.50 to $4.50; spruce, $5.50 to $6.20; pyrites, per ton of 2,240 lbs., $4.50; limestone, per ton, $1.65; sulphur, per ton, $23 to $25.

PULP NOTES.

It is reported that the Alfred Harmsworth Company, Limited, proprietors of the London Daily Mail and other English periodicals, have made an offer to purchase the saw and pulp mills of the Timber Estates Company at Millertown, Newfoundland.

J. A. Moore, of the Mooré Investment Company, Seattle, has become interested in the proposed pulp mill on the north end of Vancouver Island. Accompanied by an engineer he recently inspected the water power with a view to deciding upon plans for its utilization.

The Pentecost Lumber Company, composed of capitalists of Watertown, N.Y., are operating on the Pentecost river in the Province of Quebec. During the past winter they took out a large quantity of pulp wood which will be floated down the river to a point about twenty-eight miles from the city of Quebec, where they are establishing a large rossing plant. The officers of this company are: B. L. Taylor, president; J. B. Taylor, vice-president; H. E. Ayres, secretary-treasurer.

The Cascapaedia Manufacturing & Trading Company has been incorporated by Angus and Hugh McLean of Buffalo; Hon. W. C. Edwards of Ottawa; John Cameron of Rockland, Ont., and A. J. H. Eckhardt of Toronto. It is the intention of the company to engage in the lumber and pulp business on the Cascapaedia river, in Bonaventure County, Quebec. There is splendid water power, and the construction of the mills will be begun at once. The company own 400 miles of timber limits and is capitalized at $2,500,000.

The Bella Coola Investment Company, representing an organization of Seattle capitalists, have taken over what was known as the Thompson concession of timber limits at Bella Coola, B.C., and will have the limits surveyed. In this concession there are some 800,000 acres of fir, spruce and cedar, facing on tidal water and all within a distance of two miles from water communication. The concession also includes two water powers with an aggregate of 20,000 horse power. It is likely that most of the timber will be taken out for pulp wood. C. H. Baker, president of the Snoqualmie Falls & White River Power Company, of Seattle, is the president of the company, and A. E. Williams, a Seattle lumberman, manager.

Commenting upon the closing down of the pulp mill at Mispec, N.B., the St. John Sun says that there appears to be no reason why the mill should close at the present time, as the prices of the finished product of the mills is higher than it ever has been in the history of pulp making in St. John. Logs for making the pulp can now be obtained for between $4 and $5 per thousand feet. It requires 1,400 feet to make a ton of pulp, which is now bringing $5 and $6 more than it has done in many years, making $10 or $11 per ton as profits. The demand is unusually strong, and conditions in Canada during the past year have been most favorable towards the industry, while the United States markets are good and profits can be obtained without trouble for every pound of pulp that can be manufactured in St. John. When the mill closed down it had only on hand thirty tons, or about one day's output, unsold.

HOO-HOO.

On Friday evening, May 27th, an interesting concatenation was held in Toronto. Among those whose eyes were opened on that evening was Mr. James Lightbody, of Glasgow, Scotland, of the well known firm of F. A. Lightbody & Company. The order of Hoo-Hoo is wide spread in many corners of the world, but Mr. Lightbody has the honor of being the first member in Scotland.

The next concatenation will be held in Orillia on Friday evening, June 24th. Preparations for the entertainment of the visiting lumbermen have been under consideration for some time by the Orillia committee and an enjoyable visit is assured. There promises to be a large attendance at Orillia.

OBITUARY.

Mr. F. H. Miller.

Mr. Frederick H. Miller, manager of the Rainy River Lumber Company at Rainy River, Ont., died early in May, aged 44 years. Mr. Miller was for many years connected with the lumber industry in Minnesota. In the fall of 1902 he became part owner and manager of a large mill at Port Arthur, Ont. While there his health failed and he was compelled to resign. After a short time, however, he apparently recovered and accepted an interest in and management of the large mill at Rainy River, but last fall his health again failed and he had since been south.

Captain John T. Cameron.

There passed away at Midland, Ont., on May 7th, Capt. John T. Cameron, at the age of seventy-three years. He was born in Perthshire, Scotland, and when a lad came to Three Rivers, Quebec. Early in the sixties he left Quebec and came north in the interests of the late John Cameron, who conducted large lumbering operations. For forty-five years he remained a trusted employee of Mr. Cameron. In the early days he was engaged in taking out square timber for the Quebec market, having taken many rafts from Midland through to Quebec.

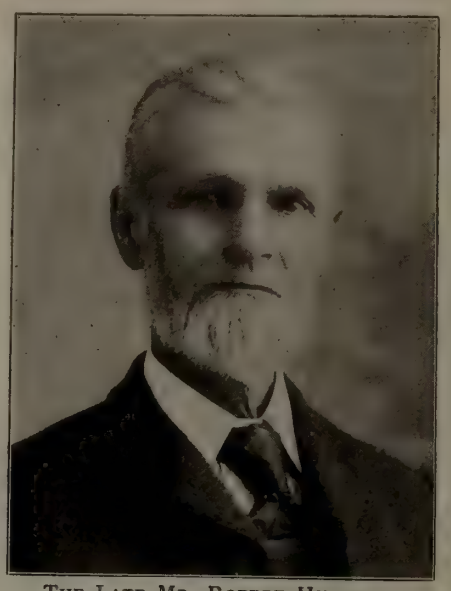
Captain Cameron was a man of great powers of endurance, and twice walked from Bruce Mines to Midland, a distance of about 300 miles, on snow shoes.

Two years ago he retired from active work and took a trip to Virginia in search of improved health. Mrs. Cameron, three sons and one daughter survive him.

Mr. Robert Hurdman.

Mr. Robert Hurdman, one of the pioneer lumbermen of the Ottawa Valley, has joined the great majority, having died suddenly of heart failure on May 4th last. He was seventy-four years of age, and the youngest and last surviving brother of the original Hurdman family, identified for over half a century with the lumbering industry in the Ottawa district.

Mr. Hurdman until recently enjoyed good health. A



The Late Mr. Robert Hurdman.

strong, robust constitution enabled him to attend, till near the end, to the details of his extensive and to him engrossing business. At an age when other men would have retired on their well earned dollars, Mr. Hurdman made further large purchases of limits and proceeded with the operation of them, confining himself to the manufacture of square timber. These limits, purchased from R. H. Klock & Company a couple of years ago and situated in the Kippewa district, were visited several times by Mr. Hurdman. A man of kindly disposition, sterling worth, always considerate of the welfare of others, his death will be regretted by many.

Deceased was predeceased by his wife in December, 1899, and leaves a grown up family of four sons and two daughters, Robert A., of Kippewa, and John, of Ottawa, being identified with the lumber business. George C. Hurdman, of the firm of Hurdman & Elmitt, Ottawa, is a nephew. In religion deceased was a Methodist and in politics a Liberal. Mr. Hurdman is survived by one sister, Mrs. Robert Frazer, of Cumberland, in her 83rd year.

Mr. Hurdman was the son of the late Charles Hurdman, who emigrated to Canada from county Cavan, Ireland, in 1818, and settled in Hull township. He was the youngest of five brothers. They were William, Charles, John, George and Robert, all well known "square timber men" in their day. The family first engaged in the lumbering business in 1866 on the Petawawa river. Until 1879 the Hurdmans devoted their attention to square timber making, but in that year they commenced log making on contract for the mills. In 1872 limits were purchased in the Kippewa district, and in 1879 the partnership known as Sherman, Lord & Hurdman was formed. In it, with the Hurdman brothers, were T. E. Lord, of Albany, and Augustus Sherman, of Potsdam, N.Y. The firm operated the old Crannell mill in the Chaudiere district, the logs being cut by the Hurdman brothers on their limits. A limit was also purchased that year in the Coulonge district. Several changes were necessitated in the firm by the death of the partners, and in 1886 the name was changed to R. Hurdman & Company, Mr. Robert Hurdman, just deceased, acting as manager at the mill. Extensive limits were purchased in addition to those already held.

In 1891 another change was made in the firm, when Mr. A. E. Buell, of Burlington, and Mr. John C. Orr, of New York, secured part interests, and the firm name became Buell, Orr, Hurdman Company.

Mr. Robert Hurdman also owned separate limits and entered into partnership with the Shepard & Morse Lumber Company, of Boston, to operate his limit in the Kippewa district. After the dissolution of this partnership he purchased limits from the Bronson Company at Deep River, which he sold to Fraser & Company. A few years ago Mr. Hurdman bought from R. H. Klock & Company the limits at Ross Lake in the Kippewa, which he operated in conjunction with his sons until the time of his death. This business will likely be continued by the sons. Mr. Hurdman's wealth never changed his manner. He was always a man, approachable and affable.

Mr. D. R. McGarvin, formerly of Chatham, has recently built a new mill at Springfield, Ont., for the manufacture of hardwood.

A STORY ANENT SLOW CAR SERVICE.

The question of delay in transit had been one the lively subjects of the evening, and when the story telling time came around Calaway got off this one:

He had two cars of lumber shipped at the same time, one via a road that we will call No. 1 and the other by another that to save the blushes of the general freight agent we will call No. 2. The car shipped via No. 1 came in within a reasonable time, and about two months later the other came in. In comparing the freight bills he noticed that while there was not 100 ft. of difference in the amount of lumber on the two cars, the one coming in on road No. 1 had a weight charge considerably in excess of that which came in on No. 2. He took the two invoices and went to file a protest with road No. 1 against the weight, and to back up his argument with the local agent, showed the invoice and weight report from road No. 2. He couldn't faze that agent, however, for the agent said: "That's easy to account for. The No. 2 road is so slow that your lumber dried out that much in transit."

Then some wag suggested that there was a chance for the railroads and the dry kiln men to get together and equip regular dry kiln cars so that instead of drying lumber at the mills it could be dried in transit.-St. Louis Lumberman.

PASSING OF A LUMBER CONCERN.

The old saw mill at Milledgeville, N. B., near the junction of the St. John and Kennebecasis Rivers, is being torn down, and this event marks the passing of a great lumber manufacturing concern, namely, L. M. Jewett & Company, formerly E. D. Jewett & Company. The mill is more than half a century old, having been remodelled several times, and the oldest mill in these parts. It has been idle for two years and for several seasons previously had run only occasionally. The end came when one of the brick stacks, 110 feet high, fell in 1902, killing three men who were making repairs and demolishing the engines and much of the machinery.

Thirty years ago the Jewetts were the largest lumber manufacturers in the province, owning and operating eight first-class mills.

Mr. E. L. Jewett, the senior partner, has now retired from active business, but retains the ownership of several fine tugs and other valuable property.

OVER 1475 CIRCULAR FILERS

now using my gauges and instructions. I give the short infallible method. Failure is out of the question. Your first saw a perfect saw. Sent prepaid on trial to honest men. Fit your saw to my gauge and if it don't run perfectly I will pay freight both ways and hammer it free.

THE CANADIAN FORESTRY ASSOCIATION.

A meeting of the Board of Directors of the Canadian Forestry Association was held in Ottawa recently, when a letter was read from Mr. E.G. Joly de Lotbiniere stating that the Government of the Province of Quebec was pleased to know that the next annual meeting of the association would be held in Quebec, and would give all assistance to make it successful, as well as continuing their already very generous aid to the general work of the association. The association has concluded an arrangement for the publication of an official organ, the first issue to be in January, 1905.

DEMANDS FOR WIRE HOOPS.

The B. Greening Wire Company, Limited, of Hamilton, Ont., report that there is a steadily growing demand for the wire barrel hoop in place of the old-fashioned elm hoop. The coopers find such a difficulty now in getting material suitable for wooden hoops that not only has the price advanced to an enormous extent, but it is practically impossible to get enough stock of suitable quality to supply the larger cooperage shops. The consequence is that in trying to use inferior stock there is a very serious loss of time and annoyance both to the cooper and shipper. The wire barrel hoop consists of a piece of No. 9, 10, 11 or 12 gauge steel wire with the ends twisted together. The Greening Wire Company claim their hoops are now made in a perfect circle, thus enabling them to slip down over the barrel into their place without binding at any particular point. The price is as low or lower than the wooden hoop.

The wire hoops are now successfully used on flour, sugar, salt and apple barrels and are coming into use on barrels for general merchandise. We would advise any of our readers interested that have not already tried the wire hoop, to communicate with the Greening Company.

VALUABLE POINTERS.

TRADE NOTES.

Messrs. Sheldon & Sheldon, of Galt, Ont., have issued an attractive catalogue of their steel plate planing mill exhausters.

A very complete catalogue descriptive of the modern pumping machinery manufactured by Fairbanks, Morse & Company, of Chicago, has lately been received.

Mr. W. B. Stewart, representing the Consumers' Cordage Company, Montreal, and the Hamilton Cotton Company, has opened offices at 18 Front Street, Toronto.

Mr. M. F. Cunningham has severed his connection (after 15 years service) with the Waltham Emery Wheel Company to assume the management of the Superior Corundum Wheel Company, of Waltham, Mass. He will make a specialty of emery and corundum wheels for the wood-working trade.

Messrs. Sadler & Haworth, Montreal and Toronto were the successful tenderers for the supply of leather belting for the International Portland Cement Company's new plant at Hull, Que. The order amounted to about 7,000 feet of both single and double belting. This is the second order Sadler & Haworth have received from this company, they having fitted up their Durham plant also.

Messrs. Woods, Limited, wholesale manufacturers of lumbermen's supplies, Ottawa, have recently completed a large and commodious warehouse and factory, which is modern in construction and finish and absolutely fireproof throughout, and which is given as low a rate of insurance as any building in Canada. It is 70x160 feet, and seven stories high, built of Indiana sandstone and steel construction. They have some 350 operators employed in their tent and clothing factories, and with the services of a number of representatives who call upon the buyers from the Atlantic to the Pacific, they are in a position to assure their patrons careful consideration and prompt execution of orders. Mr. William Green, for ten years with the Montreal Horse Clothing Company, looks after the Lower Provinces and Newfoundland. Mr. George Murray, who for twenty-three years was with James Johnston & Company and the W. R. Brock Company, covers the district from Montreal through Ontario and all east of the Great Lakes, while Mr. E. H. Taalfe, of Winnipeg, looks carefully after the interests of the company west of the Great Lakes. Woods, Limited, are in the foremost rank of Canadian business firms, and lumbermen will find it to their advantage to inspect their goods.

WORTH TEN TIMES ITS COST.

Mr. Thos. Elston, Centralia, Ont., in remitting subscription to the CANADA LUMBERMAN, writes: "I feel it has been worth to me ten times its cost."

Mr. A. McBeath, Kippen, Ont., also writes: "I would not be without it for double the amount."

Reliable Veterinary Remedies

No logging outfit is complete without a supply of reliable veterinary remedies. Getting the wrong kind means the loss of the use of your horses when time is valuable.

Johnson's Veterinary Remedies are guaranteed never to fail when used as directed. You get your money back if they ever do.

They are

Johnson's Horse Linimint No. 1.
A penetrating Alcoholic Linimint. Put up in one gallon jugs, with full directions, per imperial gal. **$4.50**

Johnson's Horse Linimint No. 2.
A combination of the best oils used as linimints, imp. gallon . . **$3.00**

Johnson's Horse Colic Remedy.
A sure and speedy cure for colic Imperial gallon **$5.00**

Johnson's Veterinary Healing Ointment.
Positively the best all-round healing ointment made. In use by the largest owners of horse flesh in Canada. Put up in 2 lb tins, each . . **$2.00**
or in ¼ lb tins, per dozen . . **$3.00**

Johnosn's Condition Powders. (Concentrated).
Put up in bulk, per lb. . . . **3c.**

These goods being put up in bulk are more economical than others, as cost of bottling, etc., is saved.

CAMP REMEDIES.

In addition to our Veterinary Remedies we make a line of medicines for lumbermen, including a strong, penetrating linimint, healing ointment, cholera cure, liver pills, cough syrup, in fact anything in the form of Camp Drug Supplies. We know that there are no better remedies made than those we offer. There may be others nearly as good, but they lack our guarantee. Satisfaction or money back. A trade discount of 10% allowed off all orders amounting to $100.

Send postal for printed matter.

Canada Chisel Tooth Saw Patent For Sale

Date November 24, 1903

Something new. No hammering required. Will run two gauges thinner than any other saw and make better and smoother lumber. The holder costs less to manufacture than the tooth, which is a very simple drop forged tooth. No milling or machine work on the plate, consequently a higher tempered plate and a plate that will require no hammering, as there is absolutety no wear in service or in changing the teeth; no rivets nor wedges. The only chisel tooth that will stand heavy feed, and in which the teeth will not spring and set from the log in use. To parties who mean business and want to control the inserted tooth saw trade in Canada, I will sell cheap. I will retain my U.S. Patent, and need more funds to push it. Other patents now pending, and will be assigned. Cut sample of tooth and holder, and sworn statement of results from a test of this saw will be furnished to those interested who have a good commercial rating, and a saw will be shipped for trial. ADDRESS—

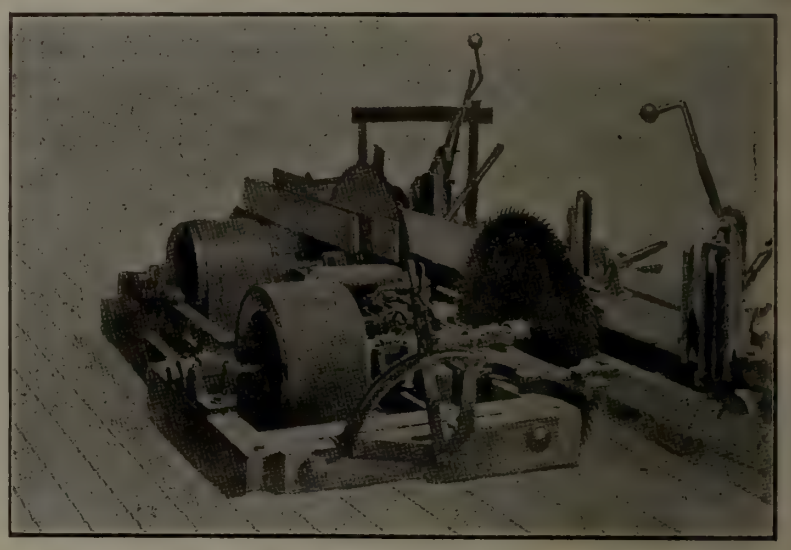
CHEMAINUS, B. C.



"KILLAM'S TANDEM CIRCULAR SAW MILL"

The attention of Manufacturers of Lumber is called to the above named latest and best method of sawing lumber.

The following advantages are obtained :

Lower cost of installation than any other method which will saw an equal number of superficial feet in a given length of time.

Smaller expense in operation, thus producing lumber at a lower cost per thousand feet than any other method.

Requires no more help to operate it than any well equipped Circular Saw Mill.

Lumber has been sawn better and more accurately cut by this method than by any other now in use.

The Killam Tandem Circular Mill requires no more skilled men to operate it than is required to operate the ordinary Circular Mill.

If solid saws are used, the larger one, when worn down can be used for the smaller one, thus saving expense for saws.

No difficulties in handling or setting by this machine and no delays.

No time is lost in setting for any thickness from the cut of stationary saw up to six inches.

This machine takes the place of a resaw in a mill and only requires a floor space of 6 ft. x 6 ft.

Also takes the place of a Twin Circular Mill that is now used for slabbing, and this machin will side as much lumber as any Twin Circular, thus saving the expense of a resaw and men to operate the same.

This machine is so cheap that any manufacturer of lumber can well afford to have one, for it will pay for itself in a short time.

Will cut 50 per cent. more lumber than the Circular Mills now in use.

MANUFACTURED BY OXFORD FOUNDRY & MAHINE COMPANY, OXFORD, N. S.

REFERENCE.

M. L. KILLAM, TRURO, N. S.

Dear Sir,—It gives us great pleasure to testify to the value of your Tandem Circular Saw Mill. It has paid for itself twice over during the six months we have run it. It requires no more help to operate it and the lumber is more evenly sawn. It does all that you claim it will and we would recommend it to any manufacturer who wishes to make more and better lumber with the same help as with the Single Circular Mill. Wishing you success, we are Yours very truly,

Dec. 31, 1903. DICKIE & McGRATH, Tusket, N. S.

THE TRIUMPH TURBINE

Is the most powerful wheel on the market to-day. A glance at this cut of the centre shows that the buckets are designed to secure the **maximum** of **speed** with **great power** and a **free discharge.** Mr. E. S. Edmondson, of Oshawa, writes as follows under date of November 16th, 1903, regarding a 26 inch Vertical Triumph Wheel:

> "The Wheel is strictly first-class in every particular, and after a careful and thorough test I am prepared to say that I believe it is the best wheel in the market for Electrical purposes. It has high speed, large power, high efficiency at part gate, and has practically no leakage. I am more than pleased with the thorough and workmanlike setting you gave me throughout."

For horizontal settings in large Pulp Mills, Cement Mills or Electric Power Developments this Wheel has no equal. We invite your enquiries. Large catalogue to be had for the asking.

We are always glad to submit estimates and prices on **Improved Vulcan and Leffel Turbines, Improved Lane Circular Saw Mills, Edgers, Trimmers, Slashers, Shingle Machines, Lath Machines** and all machinery of this kind.

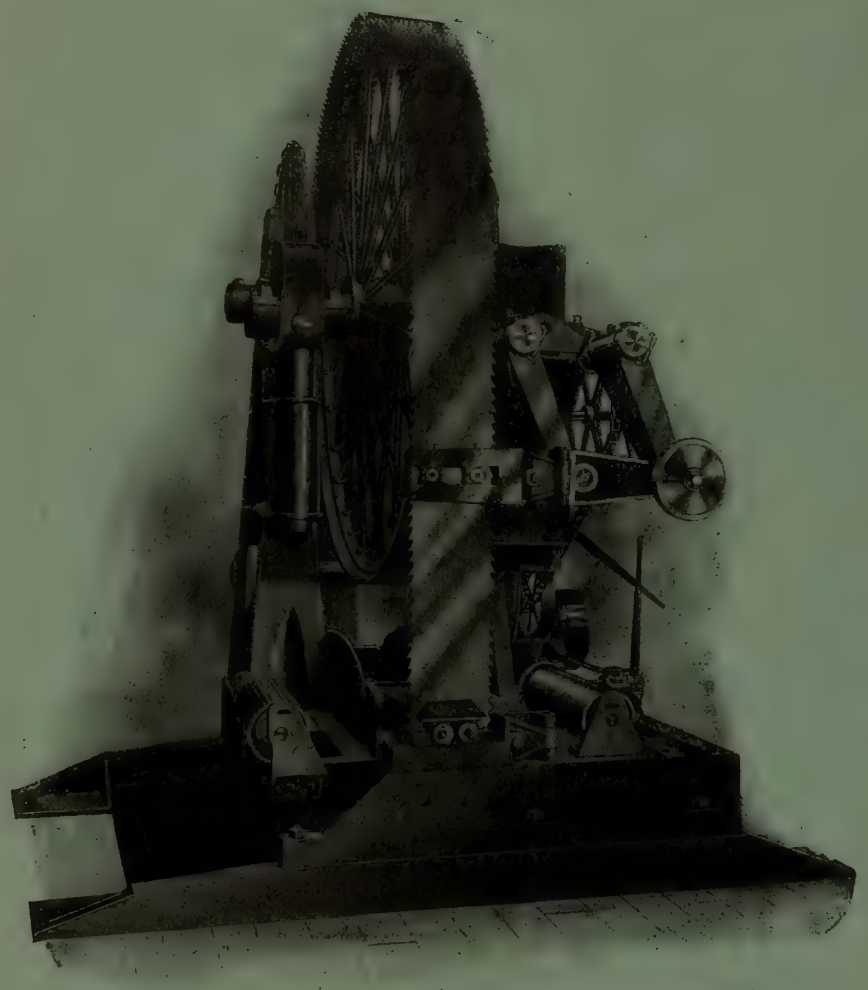
SAW MILL MACHINERY



This cut illustrates our Double Cutting

Weight Tension Band Mill

It shows the same good quality of workmanship that has made our machinery the standard for saw mills.

The top wheel is supported from above and guided below, which does away with all vibration of the wheel. Besides, sawdust cannot in any way interfere with the action of the adjusting and tension devices.

Saws can be changed on this mill quicker than on any other weight tension mill.

Send for our catalogue giving full information.

Along with this Band Mill, every saw-mill should have our

Improved Steam Setting Machine

It sets up to 4 inches, besides saw kerf, with one throw of the lever.

By its use, your daily cut can be increased easily 3000 feet, and the quality of the lumber greatly improved.

May we not send you a copy of our new catalogue illustrating this machine?

If you require anything for a saw-mill, write us—You should use our machinery.

This Saw Stands Without a Rival

AND IS THE

FASTEST CUTTING SAW IN THE WORD!

Its Superiority consists in its Excellent Temper. It is made of "Razor Steel," which is the finest ever used in the manufacture of Saws. We have the sole control of this steel. It is tempered by our secret process, which process gives a keener cutting edge and a toughness to the steel which no other process can approach.

Maple Leaf Saw Set

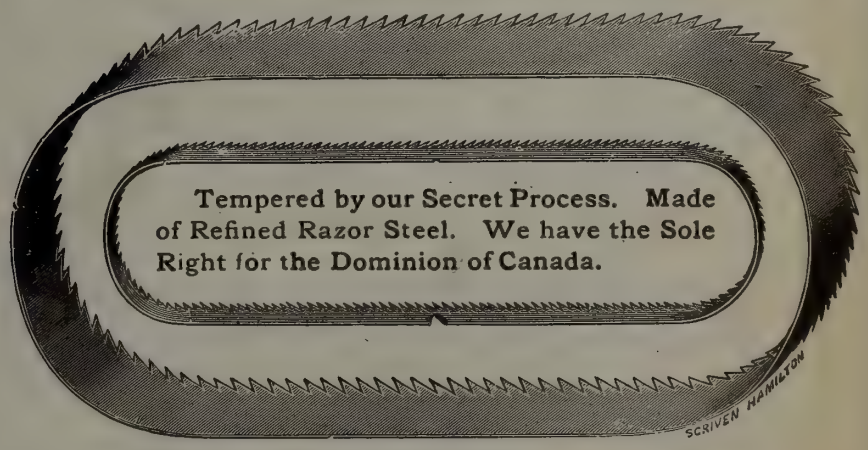
MANUFACTURED BY

SHURLY & DIETRICH, Galt, Ont.

Directions.—Place the set on the point of tooth, as shown in the accompanying cut, and strike a very light blow with a tack hammer. If you require more set, file the tooth with more bevel.

If you follow directions you cannot make a mistake. Be sure and not strike too hard a blow, and it will set the hardest saw. **On receipt of 40 cents we will send one by mail.**

We are the only manufacturers in the world who export Saws in large quantities to the United States.



We Manufacture

HIGH GRADE BAND SAWS

Of All Widths and Lengths.

These Saws are made of Refined Swedish Steel imported direct, and tempered by our Secret Process; for Fine Finish and Temper are not excelled.

Have You Investigated the Merits of Our

CLEMENT 54 INCH BAND RE-SAW?

Do So Before Buying. It is Heavier, Has a Larger Capacity and Surpasses all Others in Improvements. Give Us a Chance. We Can Convince You.

"KILLAM'S TANDEM CIRCULAR SAW MILL"

The attention of Manufacturers of Lumber is called to the above named latest and best method of sawing lumber.

The following advantages are obtained:

Lower cost of installation than any other method which will saw an equal number of superficial feet in a given length of time.

Smaller expense in operation, thus producing lumber at a lower cost per thousand feet than any other method.

Requires no more help to operate it than any well equipped Circular Saw Mill.

Lumber has been sawn better and more accurately cut by this method than by any other now in use.

The Killam Tandem Circular Mill requires no more skilled men to operate it than is required to operate the ordinary Circular Mill.

If solid saws are used, the larger one, when worn down can be used for the smaller one, thus saving expense for saws.

No difficulties in handling or setting by this machine and no delays.

No time is lost in setting for any thickness from the cut of stationary saw up to six inches.

This machine takes the place of a resaw in a mill and only requires a floor space of 6 ft. x 6 ft.

Also takes the place of a Twin Circular Mill that is now used for slabbing, and this machine will side as much lumber as any Twin Circular, thus saving the expense of a resaw and men to operate the same.

This machine is so cheap that any manufacturer of lumber can well afford to have one, for it will pay for itself in a short time.

Will cut 50 per cent. more lumber than the Circular Mills now in use.

MANUFACTURED BY OXFORD FOUNDRY & MACHINE COMPANY, OXFORD, N. S.

REFERENCE.

M. L. KILLAM, TRURO, N. S.

Dear Sir,—It gives us great pleasure to testify to the value of your Tandem Circular Saw Mill. It has paid for itself twice over during the six months we have run it. It requires no more help to operate it and the lumber is more evenly sawn. It does all that you claim it will and we would recommend it to any manufacturer who wishes to make more and better lumber with the same help as with the Single Circular Mill. Wishing you success, we are Yours very truly,

Dec. 31, 1903. DICKIE & McGRATH, Tusket, N. S.

VOLUME XXIV. NUMBER 7. } TORONTO AND MONTREAL, CANADA, JULY, 1904 { TERMS, $1.00 PER YEAR Single Copies, 10 Cents

PROMINENT BRITISH COLUMBIA LUMBERMEN.

MR. JOHN HENDRY.

Mr. John Hendry, president of the British Columbia Mills, Timber and Trading Company, is perhaps the most important man in the lumber industry in British Columbia to-day, and has had one of the most interesting careers. Descendant of milling stock, it was only natural that he should have been the man to install the machinery in the first large mill on the mainland of British Columbia when it was erected at Moodyville over thirty years ago. Mr. Hendry was born on January 20th, 1846, in the district of Belle Dune, county of Gloucester, New Brunswick, and is the second son of the late James Hendry and Magaret Wilson, who left Kilbride, Ayrshire, Scotland, on the 6th of April, 1832, in the ship "Margaret Ritchie," on which a large number came to Canada and are still living in the Dominion, and who remember the seaport Ardrossan.

The father of the subject of this sketch was engaged extensively in milling enterprises in Belle Dune, establishing flour and lumber mills. Mr. Hendry was educated at the public school in his native county, and at an early age entered the same occupation as his father. In conjunction with his elder brother, he established a mill in the distant part of the county and continued to conduct it until his father's death, when he took charge of the business and carried it on until his younger brother became old enough to assume control. His father had toward the close of his life gradually centred his interests in flour milling, and this business not being congenial to Mr. Hendry's tastes, he withdrew himself from connection with it at as early a date as possible. In 1870, before going into any other enterprise, he took a trip through a portion of the Western States, and was greatly inclined to establish a business in Duluth, which was then just springing into existence, and the excellent situation of which as a lake port Mr. Hendry clearly saw. He returned to New Brunswick, however, and again established a saw mill. For two years he continued at this, doing a large export business, one of his chief markets being the West Indies. He was restless in New Brunswick, and like most young men of enterprise decided to enlarge his knowledge of the world. He had determined to go to the Argentine Republic, and would have done so had it not been that the yellow fever broke out there and continued to

MR. JOHN HENDRY,
President of the British Columbia Mills, Timber and Trading Company.

Coast being chiefly confined to Puget Sound. He accordingly did not remain in the province, but returned to Washington territory. As he was anxious to obtain a knowledge of any details of the business peculiar to this coast, before investing capital in an enterprise, he spent the winter in Seabeck, in the employ of the Washington Sawmill Company, engaged in surveying logs and mill-wrighting. He remained there till April, 1873, when he decided to return to British Columbia. He stopped on his way at Port Gamble, where he was induced to enter the employ of the Puget Sound Sawmill Company, of which Mr. Cyrus Walker was then the local manager. Here he was engaged at the same work as at Seabeck and he had thus every facility to obtain an insight, not only into the manner in which the milling business was conducted on the Pacific Coast, but also of thoroughly learning the quality of the timber, and especially that employed in the export trade. In January, 1874, he left Port Gamble.

The Moodyville saw mill on Burrard Inlet had been destroyed, and the manager, Mr. Moody, had gone over to Puget Sound to engage millwrights for its reconstruction. Mr. Hendry determined to see how matters stood and accordingly came to British Columbia. He went to Moodyville, where he obtained the position of foreman of the mill-wrights engaged in insalling the machinery. When the mill was completed it ran day and night, and Mr. Hendry had charge during the night. He remained at Moodyville until June, 1875, using his opportunities during this time to study the business. It seemed to him then that it would be many years before the timber in British Columbia would be very valuable, owing to its abundance and the sparse population. The Red River country was then coming into prominence, and he observed the large prices which were being given for lumber in Winnipeg. He thought, therefore, that would be a better country than British Columbia to engage in the industry. He went to Winnipeg, where he remained for a very short time indeed. He was disgusted with the stunted and sickly growth of the forests of the plains after the magnificent woods of British Columbia, and he could hardly bring himself to regard as timber the articles so termed. At this time, too, business was very dull in Winnipeg, owing to the grasshopper visitation. From there he returned to the coast, and determined to settle in California. When he arrived in San Francisco he deposited his money in the bank, and looked about the country for some time. He finally decided to go to the redwood country, and was on the eve of starting when the bank in which all his money was deposited went into liquidation, and all he could get at that time was $50. He saw it was useless to remain longer in California, and he returned to British Columbia where he was known.

He went to Nanaimo first, where he spent the winter building a saw mill for Mr. Carpenter. He then went to New Westminster, where during the summer of 1876 he put up a mill for Mr. W. J. Armstrong. In the autumn he returned to Nanaimo and formed a partnership with Mr. David McNair to build and operate a sash and door factory. Early in 1877 he went to

(Continued on page 15)

BRITISH COLUMBIA SAW MILLS

Photographed and Described by Our Travelling Representative.

THE NORTH PACIFIC LUMBER COMPANY.

The accompanying illustration shows one of the earliest saw mills constructed in British Columbia after the passing through of the C.P.R. The mill was constructed in 1889 by the late Jas. Maclaren, of Buckingham, Quebec. Owing to a long period of depression in the Province it was closed for ten years until 1899, but has since been run almost steadily by its owners, the sons of the late owner. Mr. DePencier, the manager, has been connected with the Maclarens for over 37 years and has been in British Columbia since 1889. He is both popular and capable, combining a wide experience in the trade with exceptional business ability and great energy.

NORTH PACIFIC LUMBER COMPANY'S MILL AT BARNET, B. C.

The plant, consisting of a saw mill, shingle mill, planing mill, large storage warehouses and dry kilns, is splendidly situated on Burrard Inlet and the Canadian Pacific Railway at Barnet, B. C. It occupies a site of 284 acres and has a frontage on the Inlet of 4050 feet. The yard, which is without question the largest on the Pacific Coast, has all been graded by the C.P.R., 20 feet of earth having been taken away from the tracks to the water front in order to fill in their docks at Vancouver. There are fully 25 acres of piling ground with plank roads and double deckers running right through. The wires of the Vancouver Power Company run across the yard, carrying the current from Lake Beautiful to the city.

About 15 years ago the company purchased 100,000 acres of fir, cedar and spruce on Vancouver Island and the mainland, all the logs cut being towed to the mill by steam tugs. The saw mill is 350 feet long by 55 feet wide, but with the addition of the planing mill which is attached it is easily from 600 to 700 feet long. It is equipped with two band saws, large Pacific coast edger, flooring machine, automatic trimmers, slash tables, lath machines, planers and band and circular resaws. The capacity is 100,000 feet per day of ten hours. The shingle mill lies 200 feet to the east of the saw mill. It is 40 feet long by 80 feet wide and is equipped with five Dunbar shingle machines with a capacity of 100,000 shingles a day. Distributed equally across the yard are five large sheds capable of holding 3,000,000 feet of dressed lumber.

Power for driving the machinery is supplied by steam. The boiler house stands away from the main building and is thoroughly fireproof, being built of stone and steel, and lined with firebricks inside. It contains eight boilers 66" x 16' and six engines, all supplied by the Waterous Engine Company, Brantford, and the Wm. Hamilton Company, Peterborough. An electric dynamo supplied by the Canadian General Electric Company generates electricity for the lighting of the plant. In the rear of the boiler room is a blacksmith shop, machine shop and filing room.

Almost the entire stock of lumber manufactured is shipped to the North-West, Manitoba, Ontario and Quebec. However, possessing as they do splended facilities for shipping abroad, vessels being able to load at the mills for any part of the world, they have during the past two years been endeavoring with some success to develop a trade in England and Australia, several shipments having gone to England during the early months of this year.

COLUMBIA RIVER LUMBER COMPANY—CAMP.

COLUMBIA RIVER LUMBER COMPANY'S MILL AT BEAVERMOUTH, B. C.

THE COLUMBIA RIVER LUMBER COMPANY.

The accompanying illustrations show parts of the property owned by the Columbia River Lumber Company, which is unquestionably the largest concern operating in the Mountain section of British Columbia, and which is at present strongly contesting the honor of being the largest firm in the province with the British Columbia Mills, Timber and Trading Company,

COLUMBIA RIVER LUMBER COMPANY—HAULING LOGS TO GOLDEN MILL.

of Vancouver. The company was organized in the year 1887 with a paid-up capital of $750,000, the leading shareholders being Mr. Wm. Mackenzie, of the Canadian Northern Railway, Mr. Carlin and Mr. F. W. Jones. They commenced operations in 1888, after constructing a very fine mill at Beavermouth, but have since considerably enlarged their sphere of operations by the purchase in the year 1898 of the properties of the Golden Lumber Company at Golden, Jos. Genelle at Kault, and the Carlin Lumber Company at Carlin.

The mill at Beaver was built by the company in the year 1888, but on finding that it was far too small to supply their growing trade it was

entirely rebuilt on a much larger scale in the year 1899, one year after the purchase of the other three mills. The driving power was changed from water to steam, and an entirely new stock of the most modern machinery was installed. It is splendidly situated on a site of 300 acres on the banks of the Columbia River, just below where the Selkirks and the Rockies crowding together force the river through a deep and narrow gorge.

The plant consists of a saw mill, planing

COLUMBIA RIVER LUMBER COMPANY—A SNOW SHED NEAR GOLDEN.

mill and lath mill, while attached to it is a machine shop, blacksmith shop, and electric light plant. The capacity is 100,000 feet per day of ten hours.

No better facilities for transportation and shipping are to be found in the province than exist right here, the company being connected with the main line of the C.P.R. by over two miles of siding, all of which is their own property. They also possess their own rolling stock and locomotive. The mill gives employment to 70 hands.

The mill at Golden, the headquarters of the company, was built in the year 1892 by the Golden Lumber Company. In 1899 it was entirely remodelled and new machinery of the most modern type installed. In 1903 the company improved the driving power by the addition of two new boilers from the Robb Engineering Company, of Amherst, N.S. The plant consists of a saw and planing mill, and occupies a site of 50 acres. Over two and a half miles of track have been laid by the company from the main line of the C.P.R. to the mill, the transportation facilities being excellent. The capacity is 50,000 ft. per day.

The mill at Kault was entirely rebuilt in the early part of this year, a new carriage, gang edger and feed being bought from the Waterous Engine Company, and a new edger from the Wm. Hamilton Company, of Peterborough. It is situated on the shores of the Shuswap Lake in the centre of a very rich farming and ranching community. The capacity is 50,000 feet per day, the entire output going to supply the requirements of the Canadian Pacific Railway.

A well equipped sash and door factory owned by Riley & Company is run on the property.

The mill at Carlin was originally a portable mill for cutting ties. Last fall it was moved to its present site on White Creek, three miles from the main line of the C.P.R., with which it is connected by the company's own railroad and rolling stock. The capacity is 40,000 feet per day, most of it being used in the manufacture of timber and ties for the C.P.R.

Almost the entire output of 240,000 feet daily from the four mills is used to supply the C.P.R. with ties, timber, lumber, telegraph poles, fence posts, piling, etc., from Calgary to Kamloops. The surplus over and above this is shipped into Manitoba and the North-West.

The company possess the largest limits in the province, there being over 721 square miles, with an estimated stock of five thousand million feet of standing timber, all of which is tributary to the Columbia River and Shuswap Lake.

Mr. Carlin, the general manager, was born in the Eastern Townships, coming to the Northwest from Minnesota before any railroads were constructed in our Canadian west. He commenced lumbering in 1886 by taking out ties for the C.P.R., later on becoming manager of the new mill at Golden, coming to the company at its transfer in 1898.

Mr. F. W. Jones, the secretary and treasurer, was born in Detroit, Mich., of Welsh parents, who, however, emigrated to Toronto, where for thirty years this enterprising gentleman passed the early part of his career. He entered the employ of the C.P.R. in 1883, being promoted from position to position until he attained the honor of being appointed assistant general superintendent of the Western Division at Winnipeg. He left the railroad company to engage in the lumber business in 1898, coming in as partner and remaining with the present company since.

REVELSTOKE LUMBER COMPANY.

The operations of the above company in British Columbia date from ten year 1891, a sawmill being constructed and run with a capacity of 25,000 feet per day of the hours. The establishment now comprises a saw and planing mill, with double circular and band mills, automatic slash butters and trimmers, steam feed and all the latest improvements, all fitted up by the Waterous Engine Works Company, of Brantford, Ontario. Three boilers, two engines and a dynamo and engine supply the driving power and electric light.

A unique system of shipping and piling has been initiated here with the aid of tramways, dumping jacks, turn tables and push cars.

The capacity of the mill is 40,000 feet per day of ten hours, nearly all of which is shipped via the Canadian Pacific Railway to Manitoba and the North-West.

The company possess over 30,000 acres of high-class fir, cedar and spruce interspersed with quite a large amount of white pine, situated along the banks of the great Columbia River, fifty miles from the mill. The logs are cut and carried down the river to the mill, which is confronted by a big eddy in the Columbia, making a natural site for booms. Under present arrangements 3,000,000 feet of lumber can be stored in the cove in the form of booms, but the company purpose harnessing the eddy so as to make accommodation for 10,000,000 feet.

In the manufacture of house furnishings the company are without a superior on the Continent, while they also excel in the manufacture of clear cedar, over 60 per cent. of the product of the mill consisting of this class of lumber. So continuous and determined have been the efforts of the directors to produce a high-class article that despite the keenness of the American competition in cheap lumber, their business is steadily increasing.

The manager, Mr. C. F. Limbmark, and the secretary, Mr. C. B. Hume, hold a controlling interest in the firm, having obtained this as far back as 1892. They are both able men and are assisted materially by Mr. R. J. Stewart, formerly of the Northern Lumber Company, Dauphin, Manitoba. The head office is in the Hume Block, Revelstoke, all the clerical work being done under the charge of Mr. A. E. Jessop, an experienced accountant from Durham, England.

HOO-HOO.

A lodge of the Hoo-Hoo Society has been opened in Vancouver, thirty playful kittens having already been initiated.

The Crow's Nest Pass Lumber Company, Limited, purpose adding a shingle mill to their very fine plant at Wardner, B. C. With this end in view they have already purchased 3,000 acres of high-class cedar. They also intend to build a large sash and door factory in order to work up the high-grade material.

BIG EDDY SAW MILL OF THE REVELSTOKE LUMBER COMPANY REVELSTOKE B. C

For the purpose of drawing attention to their many lines of woodworking machinery, Messrs. Clark & Demill, Galt, Ont., have just issued a very fine catalogue. It is printed on an excellent quality of coated paper and contains splended illustrations of their different machines. This firm is never satisfied with present attainments, but are constantly making improvements to meet the existing demands of the trade, their aim being to produce the latest and most labor-saving machinery on the market.

VIEWS AND INTERVIEWS

No. 3 pine lath has now become a standard commodity, bringing from $1.50 to $1.75 per thousand at the mill. A few years ago it was possible to buy No. 1 lath at these figures. No No. 3 lath was made, the material from which it is now manufactured being regarded as of no value and destroyed by the burner. This is but one instance of many ecomonies that are now practised by the mill man, some of which have been forced upon him by the increased cost of timber.

* * *

In connection with the campaign against the liquor traffic, we frequently hear of "prohibition that does not prohibit." An instance has come under my notice wherein this is true of the legislation passed by the Ontario Government to prohibit the exportation of logs from Canada to the Uuited States. Mr. Joseph Walsh, of Parry Sound, is exclusively engaged in the business of selling logs for export, and,so far as I know,he has no competitor in this line of business. He purchases the logs from settlers on lands which are exempt from the recent government regulations. Two years ago he got together about 7,000,000 feet of pine, but last year could obtain only about 1,000,000feet, the remainder, about 5,000,000 feet, being hemlock and spruce. The timber is floated to the Georgian Bay and put in booms. There the purchasers take charge of it and tow it to the mills on the other side.

* * *

The saw mill man is often severely criticized for his business methods, and I am inclined to think that, in some instances at least, the criticism is justified. A gentleman engaged in the export lumber business with a very reliable firm told me that he finds the greatest difficulty in doing business on account of the neglect or unwillingness of mill men to answer letters addressed to them. He had on many occasions written for prices on stock advertised for sale without receiving a response. In his opinion, if the stock had been sold in the meantime, it would be but business courtesy to advise to that effect. He was sorry to say that he had less complaint to make in this respect about the United States lumbermen. It is true that the mill man as a rule is not fond of clerical duties; he prefers to be out about the mill, the yard, or the log pond. His neglect of matters of correspondence should not be regarded as a breach of business courtesy, or, at least, it is not intended in that light. At the same time, strict attention to the small details of a business is often responsible in a large degree for its success.

* * *

"If there is one thing that the lumbermen desire more than another, it is a continuity of policy on the part of the Governments with respect to the regulations governing the cutting of timber." This remark was made with emphasis by a prominent timber limit owner. He contended that in no other business were there more uncertainties than in lumbering operations. Too little or too much snow hampered work in the woods; the streams must retain a certain depth of water or the logs would be hung up. From the time the lumberman goes into the woods in the fall until midsummer he is in doubt as to what quantity of logs will reach his mill. These conditions are controlled by the Supreme Power and must be graciously accepted whether for loss or for gain, but controllable uncertainties should, in this gentleman's opinion, be minimized as far as possible. He referred to the changes made in the rate of stumpage dues and suggested that the Government should aim to devise some plan under which the charge would continue uniform. He did not oppose the increase to $2 in the Ontario regulations, for, being a limit holder who got in on the ground floor, or in other words a holder of old limits on which the dues are only $1, he found the value of his timber enhanced by the amount of the increased dues.

* * *

Lumber shipped from British Columbia to the United States is now subjected to an extra duty of $5.50 per thousand feet. The situation is thus explained by a correspondent: "According to the U.S. Tariff Act, 1897, Schedule D, paragraph 195, any individual U.S. Collector of Customs can add to the duties imposed by this act any export duty, tax or other charge imposed upon saw logs, shingle bolts, etc.,by any country or independency. The British Columbia Government has indirectly imposed an export tax, by providing in a recent act that all logs and bolts shall pay a tax of about $2.00 per M., but if manufactured in the province a rebate is granted reducing the royalty or tax to 50 cents per M. There are two or three mills in Washington near the boundary line that depended upon British Columbia for their supply of logs. These mills have been able to convince the Collector of Customs at Whatcomb that it is his duty to add the amount of the alleged export tax, making the duty on some grades of lumber $7.50 per M. Our provincial government will probably have to change the Act if we want to ship any lumber into the States. Our mills are very short of orders and cannot even get enough cars from the C.P.R. to fill the few orders that come in. At the same time there is a large quantity of lumber going into the North-West and Manitoba from the Washington mills. A good deal of this lumber is sized dimension lumber and should be taxed 25 per cent., but owing to the laxity of our customs officers it is admitted free. In order to evade the tax, the Americans dress one side with a planer and the other with a fine saw."

THE CREOSOTING OF TIMBER.

The advantage of creosoting as a means of preserving timber has been recognized for some time, and in England in particular this method has been adopted quite largely by railway companies, engineers, and others. Among the pioneers in this business were English Bros., Limited, Wisbech and Peterborough, who have recently sent us an interesting catalogue. They point out that reosoting more than trebles the durability of all exposed timber, and that the extra cost of the process is but from ten to twenty per cent. In the sheet piling of the river Nene the creosote wood piling driven in 1854-6 is still standing firm, while similar piling executed in 1890, only fourteen years ago, with the same class of timber, without creosoting, has seriously decayed, and has now to be replaced.

For the proper creosoting of timber special

FILLING CREOSOTING TANK.

plant and machinery are required; the wood must be closed in air-tight cylinders, and the air, having been exhausted, the creosote oil is admitted into the cylinder and forced into the pores of the wood at high pressure until an average of, say, 8 lbs. of oil has been absorbed per cubic foot of wood. Any stipulated quantity from six to twelve pounds per foot can be forced in, according to the specification and kind of timber, but, owing to the variation in the grain of different wood, one piece may, of course, absorb more or less oil than another, but the average will be reached, and all will be found impregnated with the spirit of the creosote, which completely sterilizes the wood, thus preserving from decay the sap wood as well as the heart.

It is desirable that wood should not be cut nor the face removed after creosoting if it can be avoided, as the heavier and more valuable part of the creosote oil will be nearest the surface. It is claimed that the mere superficial

CREOSOTING TANK READY FOR CLOSING.

coating of wood by dipping or steeping in creosote oil or applying it by a brush is of no use whatever as a preservative.

The two illustrations show the tank employed for creosoting timber.

The Canadian import duty on lubricating oils has been reduced from 5 cents to 2½ cents per gallon.

The Canadian import duty on pails and tubs of wood has been advanced from 20 to 25 per cent.

(Continued from page 11.)

San Francisco and purchased the machinery, and at the same time he drew the money which he had deposited in the bank there, that institution having turned out to have had considerably more assets than liabilities. During 1877 he lived in Nanaimo, conducting the sash and door factory, and in the spring of 1878 a partnership company, composed of Mr. Hendry, Mr. McNair and Messrs. Andrew Haslam and R. B. Kelly, was formed under the firm title of Hendry, McNair & Co., and a small saw mill, sash and door factory and box factory were established in New Westminster. The fishing business on the Fraser river, which was yearly becoming more important, made the need of a box factory more apparent. The business at Nanaimo was still carried on by Messrs. Hendry and McNair. In both places the business increased rapidly. In 1880 the New Westminster company found it necessary to become incorporated to hold real estate, and accordingly the Royal City Planing Mills Company, composed of the same persons as the partnership company, was organized and incorporated. Shortly after this, Mr. A. E. Lees, now of Vancouver, joined the company. Of this company, Mr. Hendry became president and general manager, and has since continued to hold his position.

In 1885 the Royal City Planing Mills Company purchased the mill at Nanaimo and continued to conduct it for a year, when Messrs. Haslam and Lees bought it, giving their share of stock in the company for it. These gentlemen having gone out, the company was now composed of Messrs. Hendry, McNair, Kelly and Beecher, the latter having purchased an interest in the industry. During the period of the boom in Port Moody real estate, Mr. Kelly sold out, leaving three interested in the concern. The business had greatly increased, and continued to increase so rapidly that when Vancouver came into existence the company established a branch there in 1887. During the great fire in 1888, their mill was in course of construction, and was one of the few buildings left standing. During this time the company had been acquiring timber limits and had secured some of the best in the province. They had hitherto done a purely local business, but they now determined to begin an export trade from New Westminster. Owing to the difficulties at the mouth of the Fraser river, and the want of a proper chart, lumber ships were chary about going up the river. The company in conjunction with the Board of Trade, of which Mr. Hendry was president, succeeded finally in inducing the government to survey and improve the mouth of the river so as to permit navigation up to New Westminster, and in 1888 Mr. Hendry had the satisfaction of seeing foreign ships loading at his mill for all parts of the world.

During the autumn of 1888 he conceived the idea of purchasing the Hastings sawmill in Vancouver to increase the company's export trade, and negotiations with this object in view were closed in October, 1889, when the Hastings mill became the property of the Royal City Planing Mills Company, with Mr. Hendry as president and general manager. Soon after the two companies were consolidated under the title of the British Columbia Mills, Timber & Trading Company. The success and prosperity of the company have been very marked, and have been due to a very large extent to the untiring efforts and foresight of the original founder, who has continued in charge to the present time.

Mr. Hendry has had considerable to do of late with railway enterprises. Some years ago he was mainly instrumental in obtaining the charter for the New Westminster Southern Railway Company, and at the present time is president of the Vancouver, Westminster & Yukon Railway Company, which has its tracks constructed from New Westminster to Vancouver, and over which the Great Northern will enter when the government bridge is opened for traffic this summer.

Mr. Hendry settled in New Westminster in 1878 and was elected to the City Council in 1888, and was chairman of the committee which had in hand the resurveying of the city. He was one of the charter members of the New Westminster Board of Trade, and served for several years as president and vice-president. He was urged to accept the mayoralty of that city in 1889, but resigned after six months in consequence of his position as chief magistrate clashing with that of member of the New Westminster Southern Railway Company. Mr. Hendry is also interested in other enterprises on the lower mainland. He is a Mason, a member of the A.O.U.W. and an adherent of the Presbyterian church. In February, 1882, he married Adeline, daughter of the late Donald McMillan, of Pictou, Nova Scotia, one daughter, Hldyen Irene, being the result of the union.

Because of Mr. Hendry's extensive interests in Vancouver, he erected a large residence in the city last year, and it is his intention to live therein.

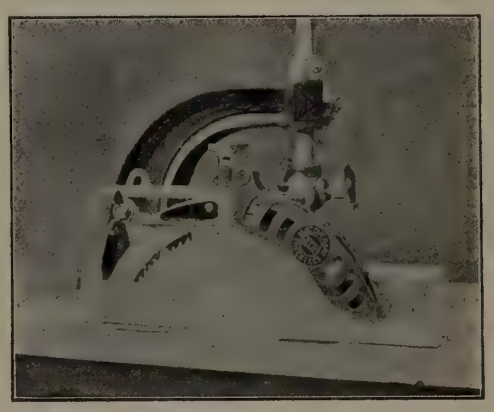
GUARDING OF CIRCULAR SAWS.

The use of saw guards in England is said to have resulted in a great reduction in the number of accidents from the operation of circular saws. The guard illustrated herewith is manufactured by M. Glover & Company, saw mill engineers and patentees, of Leeds. It is stated that these guards may be seen in government exhibition offices, intelligence bureaus, and institutions of various nations, to which they have by request been officially supplied as recognized standard inventions, and the illustration is from a photograph of one of these reproduced in Page's Magazine.

The guard is of brass and steel, neatly designed and finished. Its chief feature is its accurate adjustability, and as this, of course, is a most vital point in the construction of a saw guard, it may be useful to explain how the various adjustments are arrived at.

The illustration shows that a slightly larger saw than the one fixed may be used with the same guard by (1) raising the vertical shaft, 3, in the bracket which raises the whole guard; (2) by screwing down the milled screw, M, held by a lock nut on the top of the hood or front guard, which raises the front of the guard, thus assuming a larger circle (3) by unscrewing the wing nut, W, and slightly raising the thin steel back blade with radial slot, 7, and (4) by pulling back the rack knife, 9, to admit of the larger diameter of saw, and which back knife is held firmly by a simple device underneath the table top.

In order to cause the "Ideal" guard to collapse circularly to fit smaller sizes of saws the reverse means are used, and all the adjustments can be almost instantaneously made. The vertical shaft, 3, is first lowered, carrying the guard down close to top of saw. The milled screw, M, is then unscrewed until the front hood, 12, falls on to the curved end of the tilting holder, 9. The tilting holder, 9, is next tilted up, thus raising the end, which is shown resting just above the "wing nut," and allowing the front hood, 12, to come lower or nearer to the centre of saw to suit the smaller saw desired, there being a simple "hinged bolt," 15, the round head of which just shows underneath the "tilting holder" almost vertically above the centre line of saw, and this bolt fixes the holder in the required position. It is then necessary to unfasten the wing nut, W, and lower the "blade," 7, with radial slot to suit the saw, 7, after which the "back knife," 6, is moved closer to the smaller saw and fixed in position by a thumb screw under the table top. The bracket, 1, must be



STANDARD "IDEAL" SAW GUARD.

bolted to the table to allow of the shaft, 5, supporting the guard being fixed above and exactly central, and parallel with centre line of saw spindle, and the "back blades" or "knives" must be exactly in line with the saw.

It will be readily seen that the "front hood," 12, bearing name can be at once lowered or raised, is held in position on the T slide on "tilting holder," 9, by means of the small hand wheel, 11, and bracket, while by a turn of the "wing nut," W, which is on a T headed bolt, the "back blades" can be immediately disconnected from the brass portions of the guard, which can be swung round if desired for any particular purpose, and swung back again into exactly the same position by means of the safety collar on shaft, 3.

The Ontario Government has appointed a forester, in the person of Dr. Judson Clark. Dr. Clark is a graduate of the Agricultural College, Guelph, and received his forestry training under Dr. Fernow, late of Cornell University.

Much dissatisfaction is felt among British Columbia lumbermen, through the checking of the growth of a trade in special grades of mill stuffs to the United States, owing to the retaliatory legislation of the United States Government, because the British Columbia legislators had the presumption to put a stop to the denundation of their forests by United States citizens, without substantial benefit accruing to the people of this province. The United States Consul informs our representative that a tax of $5.50 per thousand feet has been imposed on British Columbia rough or manufactured timber under Section 194 of the Dingley tariff.

THE Canada Lumberman

21 GREAT ST. HELENS, LONDON, E. C.

The LUMBERMAN Weekly Edition is published every Wednesday, and the Monthly Edition on the 1st day of every month.

TERMS OF SUBSCRIPTION:
One Copy, Weekly and Monthly, One Year, in advance, $1.00
One Copy, Weekly and Monthly, Six Months, in advance, 50
Foreign Subscription, $2.00 a Year.

ADVERTISING RATES ON APPLICATION.

THE CANADA LUMBERMAN is published in the interests of the lumber, wood-working and allied industries, being the only representative in Canada of these important interests. It aims at giving full and timely information on all subjects touching these interests, and invites free discussion by its readers.

Especial pains are taken to secure for publication in the WEEKLY LUMBERMAN the latest and most trustworthy market quotations throughout the world, so as to afford to the trade at home and abroad information on which it can rely in its operations. Subscribers will find the small amount they pay for the CANADA LUMBERMAN quite insignificant as compared with its value to them. There is not an individual in the trade, or specially interested in it, who should not be on our list, thus obtaining the present benefit and aiding and encouraging us to render it even more complete.

Advertisers will receive careful attention and liberal treatment. For manufacturing and supply firms wishing to bring their goods to the attention of owners and operators of saw and planing mills, wood-working factories, pulp mills, etc., the CANADA LUMBERMAN is undoubtedly the cheapest and most profitable advertising medium. Special attention is directed to "WANTED" and "FOR SALE" advertisements, which are inserted in a conspicuous position on front page of the Weekly Edition.

HARDWOOD INSPECTION RULES REJECTED.

The outlook for the adoption of national rules for the inspection of hardwood lumber throughout the United States and Canada is much less promising than a few months ago, events having taken an unexpected turn. A brief history of the movement is necessary to an understanding of the situation. The National Hardwood Lumber Association was organized in 1896 for the avowed purpose of securing the adoption of uniform grading rules, its membership being composed of both the wholesale dealers and manufacturers, with the former predominating. The rules for which they sought recognition were adopted by dealers in all parts of the country and by the Wisconsin Hardwood Manufacturers' Association. They did not, however, meet the ideas of all manufacturers, some of whom, about two years ago, organized the National Hardwood Manufacturers' Association, with the intention of framing rules more in the interest of the manufacturer. The advantage of having but one set of rules being recognized by both associations, a joint committee was appointed to fix upon a uniform basis for the inspection of all kinds of hardwood lumber. This committee framed a new set of rules, which were to receive the sanction of a majority of the members of each association before becoming effective.

The National Hardwood Lumber Association held its annual meeting on May 22nd last, and declined to adopt the rules arranged by the joint committee. A resolution to amalgamate the two associations was also rejected. Thus the adoption of national rules is far from being accomplished, as the breach between the dealer and the manufacturer would appear to have been widened by this action of the association. There are some dealers, among whom is Hon. J. N. Scatcherd, of Buffalo, who claim that, lumber being produced at so many different points and shipped to so many different markets, it is almost impossible to formulate a set of rules which would prove acceptable to manufacturer, millman and consumer. Whether this is the case time alone will tell.

Canadians have been watching with much interest the outcome of the agitation and plans for uniform inspection of hardwoods across the line, and which it is intended shall eventually extend to Canada. One or two informal meetings of the hardwood dealers have been held in Toronto for the purpose of taking similar action for a limited district, but the business is in such a crude state that much discussion and diplomatic adjustment will be necessary before anything tangible is arrived at. It is earnestly to be hoped that the matter will not be permitted to drop, as recognized rules even for Toronto and Western Ontario would be better than the entire absence of definite rules, as at present.

CONDITIONS INSPIRE CONFIDENCE.

Within the past year the opinion has been many times expressed that the crest of the wave had been reached in the present era of commercial and industrial prosperity in Canada and the United States. Evidence has not been lacking of late that this prediction was well timed. There has been a falling off in the consumption of many commodities, prices of which have shown a gradual decline for some months past. The decline in the price of iron and steel products has been, we think, more marked than in almost any other class of material which enters into construction work.

There are already indications that the bottom has been or will soon be reached in the declining tendency of iron and steel prices. The reaction has been of a healthy character, and has proceeded without serious disturbance to either capitalists or the laboring classes. It has, on the other hand, permitted construction work to be undertaken at a moderate cost, a condition which is certain, sooner or later, to lead to industrial activity. In the United States, where slackening of trade has been the more pronounced on account of a Presidential election five months hence, building operations are more active than at any time in the past two years. In Canada the reaction has been scarcely noticeable except for the dumping policy pursued by certain United States manufacturers. Building is flourishing throughout almost the entire Dominion. In the city of Winnipeg alone buildings to the value of over $5,500,000 have been built this year or are in course of erection, and in British Columbia there is activity in the same direction. Generally speaking, the enlarged building operations are not in the nature of a boom, as speculative building is at a standstill, except perhaps in Winnipeg, to which point many Americans have been attracted. The buildings are needed for the accommodation of the people and must be erected almost regardless of cost.

Crop prospects are favorable to good business conditions. The United States is promised an abundant yield of wheat, corn and cotton—the three leading staples. From the Canadian North-west comes the report of very favorable weather conditions and prospects of a heavy production of No. 1 wheat. With these predictions fulfilled, a substantial impetus would be given to industrial and commercial development.

Still another factor is favorable to an improvement in trade, namely, a fixed tariff policy. The budget speech of Hon. Mr. Fielding, Minister of Finance, clearly shows that there is to be no change of principle by the Dominion Goverment in respect to the tariff. The Republican National Convention has chosen Hon. Theodore Roosevelt as the standard-bearer of the party, and present indications point strongly to his election. The platform adopted by the convention declares adherence to the system of protection, rates of duty to be adjusted only when conditions have so changed that the public interest demands it. Thus, it would appear that the existing tariff laws of the United States will rule for another four years.

Summing up, there is reason to anticipate an improvement in business during the next twelve months. The uncertainties which have existed and which have induced capitalists to pursue a conservative policy in respect to new undertakings are gradually being removed, and a more confident feeling is sure to develop.

EDITORIAL NOTES.

There is a good deal of misconception regarding the properties of Mountain tamarac, or what is known in the western part of the United States as larch. It has been confounded by many dealers and contractors with the inferior eastern swamp tamarac, a very poor class of lumber. The western product is of a very rich even color, greatly resembling cedar, although the grain is not so pronounced. It furnishes one of the best of high grade finishes, not taking second place to fir or any other high grade Coast lumber. It is not so hard as fir, but takes a very fine polish, and is easier to work, being especially well adapted for flooring, mouldings, and wainscotting. All the Winnipeg factories are very anxious to secure it in clears.

The appointment of Dr. Clark to the position of forester for the Ontario Government has raised a question as to the duties of this office. The opinion has been advanced that it is a preliminary step towards the application of a practical forestry system to the extensive forest reserves which have been set apart by the Government and which will doubtless be increased at each favorable opportunity. Hon. Mr. Davis, Commissioner of Crown Lands, announced some time ago that it was proposed to sell the timber on these reserves as it matured, under the direction of the Crown's forester, and it may be that Dr. Clark's duties will be the supervision of this work. It is to be hoped that in perfecting their forestry system the Government will give due attention to the preservation of the hardwoods, which are in steadily increasing demand and which furnish the raw material for many of our largest furniture and other factories.

VIEWS OF PROMINENT B. C. LUMBERMEN.

Mr. H. H. Spicer, of Woods & Spicer, Vancouver :

"The particularly unsatisfactory condition of the shingle trade in British Columbia is owing to the fact that the capacity of the British Columbia mills is more than four times in excess of the demand from all parts of Canada. To all parties acquainted with the trade it is well known that lumber and shingles from the United States are allowed free entry into Canada, we thus being deprived of a very considerable portion of a trade which is already far and away too small to take care of the ordinary output of our mills. This competition is particularly severe at present on account of the depressed condition of the lumber trade in that country. So keen has this competition become that they are using our Canadian territory as a dumping ground for shingles and low grade lumber. In my idea there is no reason whatever why the government should not grant us protection against the products of the U. S. mills. The farmers of Manitoba and the Territories should be willing to buy Canadian lumber and shingles and to pay a fair price for them, for the reason that the people of Britisn Columbia are among their best customers. The farming community are protected and why should the government deny us protection, or at least secure for us free access to the United States market? The effect on the settler of the west could not possibly be detrimental and prices could not go beyond a reasonable figure, as there are so many mills in Western Canada that the natural course of competition will at all times prevent prices from reaching unreasonable limits. I feel very strongly against the selfish policy of the northwestern farmers and cannot for the life of me understand how they can lose sight of the fact that if we are not prosperous it will certainly affect them. Furthermore, we are a growing community and possess all the resources that go to make up a great manufacturing country which some day will prove a boon to the settlers of the great west. Why the goverment are prepared to grant protection to one industry and section and not do the same with the rest I cannot understand. On the other hand, if they are determined on free trade why are they so inconsistent as to protect every other trade but lumber?"

Mr. E. H. Heaps, Vancouver :

"While we are kept fairly busy owing to the fact that we are one of the oldest firms on the Coast, yet we feel there is great danger ahead for the lumber industry in the efforts the Americans are making to supply the Canadian market with their lower grades of lumber, which, of necessity, means the prevention of the marketing of our lower grades unless we are prepared to sell at a loss as they are doing, I being in possession of a statement to that effect. They cannot cut lumber for less than $2.50 a thousand feet ; while their logs are costing them from $6 to $7 ; and yet they are selling at $3 a thousand in the Northwest and Manitoba. They are in a different position to what we are. In this country if we do our own logging, as most of us do, we have to take the timber out of the woods just as we come across it. That gives us a very large proportion of rough logs, while even on good land we usually only succeed in procuring two or three good logs, the top ones being generally rough. Our local market being very small we find great difficulty in marketing our rough lumber. Down in the Sound business is carried on by large logging companies who usually grade the logs after placing them in the water and who will sell a mill a boom of logs of any desired grade. This enables a mill to buy logs that will satisfy customers and also enable them to escape the manufacture of a large amount of unprofitable lumber. The American local and home markets consume a very large quantity of rough lumber, but not sufficient to meet the supply, consequently they have been entering the Canadian market and selling over ten to twelve million feet per month at prices that would leave no profit to a British Columbia mill. This condition of affairs has prevailed for some years but it has become much worse since the commencement of the American industrial depression. The amount they marketed last year in the Territories and Manitoba, it is estimated, was 100,000,000 feet, and at the rate it is coming in this year it is expected these figures will be increased to 150,000,000 feet. It is estimated that the New Ontario mills and the small mills scattered through Manitoba manufacture about 150,000,000 feet per year, the Mountain mills of British Columbia about 150,000,000 and the Coast mills about 100,000,000.

"Another danger to the coast mills is seen on account of the large proportion of lumber produced in the Mountains being rough lumber. These mills being much nearer to the great manufacturing centres have to pay much less in freight charges than we have, and coupled with the importations from the States it appears as if it will be almost impossible for us to market our rough lumber.

"The government's position regarding the state of the trade is a very amusing one. While they are doing their best to regulate the price of lumber for the benefit of the settler, why do they not also in his interests try and fix the price of the land owned by the C.P.R., also the freight rates charged for the transporting of his produce? The answer to this and one that is indisputable is that the C.P.R. has to depend mainly upon the lumber trade for its east bound freight. The high rate they charge increases the cost of lumber to such an extent that dissatisfaction has been aroused, and in order to divert attention from the manifest unfairness of such rates the C.P.R. with its tremendous power has succeeded in throwing the blame for the high prices upon the lumberman. The freight charges, it is estimated by the secretary of the Western Retail Lumbermen's Association, amount to one and a half times the total cost of production at the mill. In conclusion I am firmly convinced that unless the government take action to assist us their day of reckoning in this province will soon arrive."

Mr. J. G. Scott, Pacific Coast Lumber Company, Vancouver :

"The Dominion Customs Tariff, 1897, in section 611, provides for the free admission into Canada of sawed or split boards, planks, deals and other lumber, when not further manufactured than dressed on one side only. This section goes on to enumerate a long list of wood products including "shingles of wood." The United States Tariff of 1897 in section 195 provides for a duty of $2 per thousand feet board measure on rough lumber and an additional duty of 50 cents per thousand feet for each side planed, or if planed and tongued and grooved $1.50 per thousand feet This same paragraph provides that if any country imposes a tax against the export of logs an additional duty shall be imposed equal to the amount of such tax on the articles mentioned in this section.

"The Dominion Government sanctioned the placing of lumber and shingles on the free list in the first instance as a reciprocal move in return for these same articles being placed on the free list by the United States Government under the provisions of the McKinley Tariff. Later the U.S. Dingley Tariff came into effect, enforcing the above mentioned duties, but no similar move has been made by the Dominion Government. At the time the Dominion Customs Tariff, 1897, was before the House, the lumber manufacturing industry of Canada protested against the free admission of lumber and shingles and have continued to protest and to advance arguments in favor of their contentions at every possible opportunity year after year without result as yet. No arguments in refutation have ever been advanced against our request being granted. Several years ago, when a large deputation of lumbermen from the various Provinces waited on Sir Wilfrid Laurier, in support of our contention, an unqualified admission of the unfairness of our position was made by the Premier, who made out that a Tariff commission composed of delegates from the Imperial and Dominion Governments was to meet shortly at Washington, when it was hoped the cause of reciprocity would be advanced, and that it might be regarded as prejudicial to this cause if the Dominion Government took action just then in the way of imposing a duty on lumber and shingles. We were further led to expect that should nothing result from the labors of the commission, we might expect the government to take action. As you know, the efforts of this commission were fruitless, and notwithstanding the fact, no steps have been taken to remedy the existing anomoly in the Dominion Customs Tariffs, and no tangible reasons have been advanced why this should not be done.

"In the faith that the industry would ultimately get fair play from Ottawa, there has of late years been a very heavy increase in the number of lumber manufacturing plants, both on the coast, in the interior of the Province, and in the North-West Territories, and several millions of dollars have been expended in the erection of the most modern and most labor saving plants, whose combined capacity is more than sufficient to supply present existing demands within our own Dominion, and competition among the Canadian manufacturers themselves is keen. The proximity of the manufacturers of Washington, Idaho, Montana, and Minnesota to certain of our Canadian markets, gives them natural advantages in the way of shorter hauls and lower freight rates and renders them at all times formidable opposition, but although this opposition has been noticeable and has retarded the development of the industry in this Province it has never been as keenly felt as during the past year or two, owing to the fact that American conditions are at the present time badly disturbed. The usual unrest preceding the Presidential election has brought on business depression in building lines and overproduction in lumber and shingles, and as a result all available Canadian markets are being used as temporary dumping grounds. I presume that this acute state of affairs will not be permanent, probably within two years conditions on the American side will again be normal, but I think I am speaking well within the bounds of moderation when I say, that should the present unfair tariff conditions be allowed to remain, there is very grave danger, if not absolute certainty, that the result will be the complete elimination of many British Columbia mills, and later on when the American producers withdraw from Canadian markets to operate in more profitable fields, it will be found that there will not be enough Canadian mills in operation to respond to the demand, and any temporary advantages the Prairies now have will cost them dearly in the long run.

"Monied men in Eastern Canada, encouraged by the heavy emigration into our Prairie Provinces, have, in good faith, found means to build many modern plants that have gone up recently in British Columbia. If our claims receive no recognition at Ottawa, these ventures will result in loss and disaster, and the industry will sink into a state of disrepute that will take a long time to recover from, and when it is fairly taken into consideration the amount of money that the lumber industry brings into the Province for distribution, it will be realized that the prosperity of the Province is more dependent on the lumber business than is generally known, and, if our mills close down, the effect will be widely felt.

"The attention of the Dominion House was recently drawn to the condition of the lumber industry on the Pacific Coast by some of the British Columbia members, when representatives from the Territories spoke against the case of the British Columbia members, making use of many entirely unstatements, among them, the statement that the British Columbia manufacturers had entered into a combine with lumber dealers in the North-West. I maintain that this is an absolute falsehood. No combine whatever exists now or ever did exist or could possibly ever exist. As to the oft repeated statement that prices are unduly high, I would remind any man who makes such a statement that saw mills have not as yet been dividend payers, the business, until the past year or two, having been a wholly unprofitable venture, and probably over 85 per cent. of those who have embarked in the line thus far, have experienced disastrous failures. Any banker or business man in the country who has followed the history of the trade can attest to the correctness of this statement, so that the statement that we are making too much money sounds to us like ironical mockery.

"The woollen manufacturing trade is pressing for an increase in their duties. I have heard the statement made that the reason their business is unprofitable may be accounted for by the fact that they continue to operate with antiquated machinery and methods. Whether this be true or not I cannot say, but no such assertion can be made regarding the lumber industry here, as B.C. has mills equipped with the most modern machinery in the world. The wages we pay are admittedly high, but the expense of living here is equally high, and any attempt on the part of the manufacturer to materially reduce wages would be sure to produce industrial strife, and should be avoided as far a possible."

TIMBER REVENUE IN QUEBEC.

A comparative statement of the amounts collected annually since 1867 for ground rent, bonuses, transfer fees and timber dues in the Province of Quebec is as follows :—

Fiscal Year	Ground Rent	Bonuses	Transfer Fees	Timber Dues.
	$ cts.	$ cts.	$ cts.	$ cts
1867-68	22,401 03	3,928 50		65,381 77
1868-69	55,055 06	74,894 97		98,977 82
1869-70	64,089 20	22,518 37	1,584 00	267,468 08
1870-71	63,297 43	62,437 34	4,790 00	272,833 12
1871-72	86,783 01	56,191 81	4,686 00	292,989 42
1872-73	90,950 84	68,941 18	9,242 66	346,361 27
1873-74	97,220 37	31,383 93	5,384 00	361,080 51

1902-1903	187,206 25	352,004 58	20,076 00	657,631 96

QUEBEC TIMBEER LANDS.

The annual report of Hon. S. N. Parent, Minister of Lands, Mines and Fisheries for the Province of Quebec, states that the ordinary revenue in 1903 of the woods and forests branch, including timber dues, ground rents, transfer bonuses, and fines for infringements, amounted to $879,910.40. The sale of timber limits by auction in June last realized $361,904.09, bringing the total receipts to $1,241,814.49. The receipts are larger than any previous year. The amount collected for timber dues exceeded that of any previous years with the exception of 1898. Particular mention is made of the bonuses on transfers, amounting to $20,108, due to the changes made in the regulations in 1901 by which these bonuses, which formerly were $1, were increased to $4 for each square mile transferred.

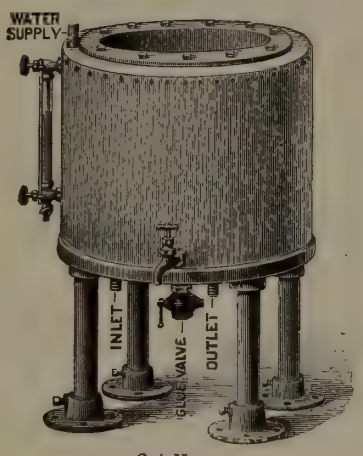
The Commissioner points out the great difference between the Quebec forests of fir and spruce and those to be found in Ontario consisting almost exclusively of pine of the finest growth. He argues that when conditions are considered, the prices realized for limits in Quebec compare very favourably with the results of sales in other provinces. The Quebec limits which have been sold are entirely without means of communication and transport. The lumber shanties are supplied by canoes in summer and chiefly by sleighs in winter, with long distances to cover; while the logs have to be floated a proportionate distance down rivers broken by rapids, longer and more winding than in Ontario. The latter province is also more favourably situated to market its lumber in the United States. The Commissioner states that radical changes are imperatively necessary in the fire laws in order to properly protect the forests from fire.

The following is a statement of the timber cut on Crown lands in Quebec during the twelve months ended June 30th, 1903:

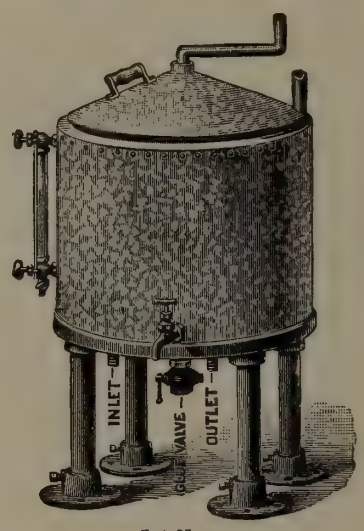
Area under license	62,730	sq. miles
Square timber, hardwood	56,647	cubic ft.
Square timber, pine	506,768	"
Spruce, hemlock, cedar, white birch, balsam, and poplar saw logs and boom timber	288,168,124	ft. B.M.
White pine saw logs and boom timber	199,079,069	" "
Red pine saw logs and boom timber	23,578,926	" "
White pine saw logs, 11 in. and under	60,565,280	" "
Pulp wood	202,633	½ cords
Timber for poles	703,573	lin. ft.
Railway ties	542,871	pieces
Pickets	7,319	"
Rails	7,147	"
Shingles	2,349,500	"
Hemlock bark	436	cords
White birch for spoolwood	7,696	"

IMPROVED APPLIANCES FOR

HANDLING GLUE

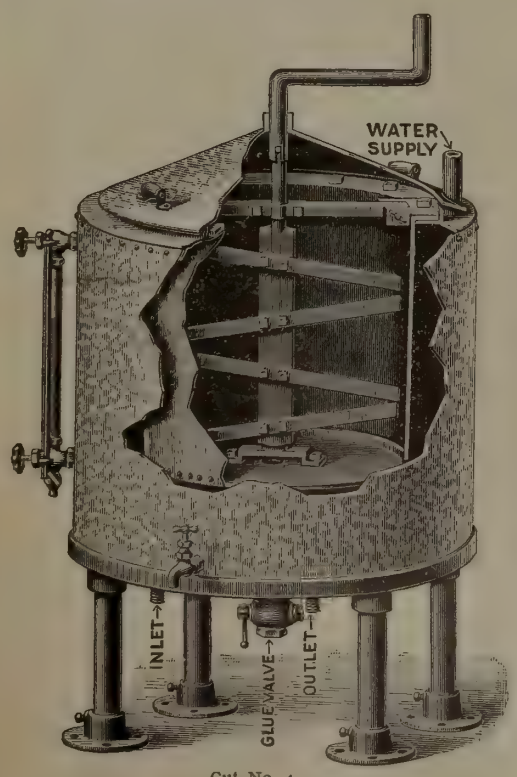


Cut No. 1.
No. 61 BOILER.



Cut No. 2.
No. 61 BOILER.
With heavy galvanized iron lid, fitted up complete with Glue Stirrer.

Cut No. 3.



Cut No. 4.

STEEL GLUE BOILERS OR COOKERS (Galvanized)

Cut No. 1, 6 gallon Steel Glue Boiler, and cut No. 2, same Boiler with Heavy Galvanized Iron Cover and arranged with Glue Stirrer. Cut No. 3, a 20 gallon Boiler or Cooker, No. 63, giving a sectional view, showing arrangement of Copper Tube Coil for heating the water.

Cut No. 4 shows a No. 63 (20 gallon) Boiler or Cooker with Heavy Galvanized Iron Cover and sectional view showing arrangement of Glue Stirrer.

Made of Heavy Sheet Steel, both Water Jacket and Glue Pot well Galvanized. The Steam Pipes are connected to a Coil of Heavy Copper Tubing; in this manner the water is quickly heated and the steam can be piped back through trap to steam boiler, thus causing very little loss of steam and overcoming all danger of bursting the Glue Boiler, as all steam pressure is confined to the Copper Tubing. Other features are fully described in our catalogue of **Modern Glue Room Appliances.** If interested,

IMPERIAL BUILDING MONTREAL.

310 MCINTYRE BLOCK, WINNIPEG.

21 GREAT ST. HELEN'S, LONDON, E. C.

The Weekly Lumberman — Published every Wednesday, contains reliable and up-to-date reports of market conditions and tendencies in the principal manufacturing districts and leading domestic and foreign wholesale markets. A weekly medium of information and communication between Canadian timber and lumber manufacturers and exporters and the purchasers of timber products at home and abroad.

The Monthly Lumberman— A 32-page journal, discussing fully and impartially subjects pertinent to the lumber and wood-working industries. Contains interviews with prominent members of the trade, character sketches and portraits of leading lumbermen, etc. Its special articles on technical and mechanical subjects are especially valuable.

WANTED AND FOR SALE

Advertisements will be inserted in this department at the rate of 15 cents per line each insertion. When four or more consecutive insertions are ordered a discount of 25 per cent. will be allowed. This notice shows the width of the line and is set in Nonpareil type; 12 lines make one inch. Advertisements must be received not later than 4 o'clock p. m. on Tuesday to insure insertion in the current week's issue

WANTED.

TO CORRESPOND WITH RELIABLE PARTIES who are looking for good site for a Furniture Factory. Address, BOX 145, CANADA LUMBERMAN, Toronto.

FOR SALE

2,000 acres of Hardwood Land in Antigonish County, N. S., close to railway sidings. The James River runs through the centre of 1,250 acres. Apply to

J. S. O'BRIEN,
Antigonish, N. S.

WANTED

To sell a quantity of XX, XXX and XXXX 18 in. Cedar Shingles. Carefully packed and guaranteed to give satisfaction in every respect

HURDMAN & ELMITT,
Ottawa, Ont.

FOR SALE

200 M feet Spruce flooring, 200 M feet of prime White Pine lumber, 200 M feet Hemlock.

On a 13 cent rate to Winnipeg and Fort William 75,000 feet of Poplar 1 in., and 75,000 feet of Spruce 1 and 2 in. Apply Box 111, CANADA LUMBERMAN, Toronto.

FOR SALE—BIRCH. ABOUT 500 M; MAY be cut to order. BOX 134, CANADA LUMBERMAN, Toronto

WANTED—DRY PEELED BASSWOOD, 4 feet, immediate delivery. Highest price paid. RANKIN & CO., Toronto, Ont.

FOR SALE—SAW MILL, 50 M FEET PER 10 hours, in good working order; 10 acres, Freehold having 17 chains sea frontage; C.P.R. siding; city electric light and water. YOUDALL & CO, Vancouver, B. C.

WANTED — MANAGER FOR A LARGE Planing Mill and Lumber Yard. Good salary for experienced and thorough business man. Apply Box 147, CANADA LUMBERMAN, Toronto.

FOR SALE—70 H.P. FIRE BOX BOILER with Water Front, good for 100 lbs. steam pressure, cheap for quick turn-over. Address, Machinery Exchange, 22-24 Victoria Square, Montreal, Que.

WANTED—BY A RESPONSIBLE OFFICE man with experience in woods and manufacturing departments of large wholesale lumber business, a position of trust or prospect of advancement with a lumber firm. Apply Box 148 CANADA LUMBERMAN, Toronto.

SALE OF

TIMBER LIMITS

—AND—

SAW MILLS

The following Limits and Saw Mills are offered for sale by Tender:

1. ***Algonquin Park Limits,*** consisting of berths in Peck, Hunter and McLaughlin Townships.

2. ***Trent and Moira Limits,*** consisting of Licensed lots in Peterboro, Hastings, Haliburton and Addington Counties.

3. ***Deeded Lots*** in Peterboro, Hastings and Addington Counties.

4. ***Trenton Saw Mill.*** This Mill is at present in running operation. Intending purchasers can look it over in actual operation at any time and arrange for delivery at the end of the Sawing Season 1904.

5. ***Algonquin Park Mill.*** A quantity of machinery and plant, including a Burner, which can be seen at any time at Canoe Lake on the Canada Atlantic Railway. Immediate delivery given if required.

For particulars apply to

GILMOUR & COMPANY, Limited,
TRENTON - ONTARIO - CANADA.

FOR SALE—200,000 FEET GOOD SPRUCE, mill run, culls out, not butted. Apply, THE ARTHABASKA CHAIR COMPANY, LIMITED, Victoriaville, P. Q.

WANTED — TEN THOUSAND CORDS Hard and Soft Wood; also same quantity of Slabs. SIMCOE WOOD AND LUMBER CO., 52 Yonge Street Arcade, Toronto.

GOOD PORTABLE MILL FOR SALE, A bargain, at Dayton Station, good locality for ties, lumber and shingles. Plenty of timber available. DOBIE & CO., Thessalon.

WANTED—POSITION AS BOOKKEEPER, now head book-keeper for large lumber and maple flooring concern Seven years' experience in lumber business, also stenographer. Address Box No. 149, CANADA LUMBERMAN, Toronto, Ont.

FOR SALE.

RED PINE DIMENSION CUT TO REQUIRED sizes. Also two parcels of standing Timber, nearly all White Pine, good quality. PINE LUMBER CO., Pine, Ont., near Cartier.

Toronto.

CURRENT TRADE CONDITIONS.

ONTARIO.

The weather of the past week has been very favorable to lumber activity and we think there has been a slight improvement in the demand. Conservatism still characterizes the action of buyers, however, and there is not likely to be any decided change in the near future. Dealers are not loaded with stock and must continue to buy more or less for requirements. This is about all that is expected during the next two months. The crops are making satisfactory progress and business conditions generally are good.

Late reports regarding square and waney timber confirm the opinion advanced that the outlook is not very encouraging. From what we can learn there appears to be an overproduction, which has come at a time when the consumption is declining. Manufacturers who sold their timber in advance were particularly fortunate, as there has been a decline of fully five cents per cubic foot in the price of waney and a proportionate decline in square timber. The salvation of the market would seem to depend upon a curtailment of operations on the part of manufacturers. If this policy is pursued it should be possible to maintain prices at the present reduced basis, but

if operations are continued with little regard to demand, the result will doubtless be a further decline in values. The wisdom of the former course should be apparent to all operators when it is remembered that the cost of getting out timber has increased during the past few years quite in proportion to the advance in price.

QUEBEC AND NEW BRUNSWICK.

Spruce lumber prices have not suffered a further decline, although the market is still very unsettled. Manufacturers generally will curtail sawing operations as far a possible. There is a very good demand for American specifications. Most of the log drives are nearing the booms, and it is estimated that 34,000,000 feet will be hung up on the St. John river, including 6,000,000 feet on the Aroostook. The amount already in the Douglas and Mitchell booms is about 145,000,000 feet.

Extra cedar shingles are freely offered at $3.30 for Boston delivery. Clears at $2.75 and second Clears at $2.25.

UNITED STATES.

Compared with one year ago the movement of lumber throughout the United States shows a falling off, not marked, but sufficient to prevent any recovery in prices from the decline which has taken place during the past six months. The curtailment in demand has resulted largely from a decreased consumption by the railroads, as building operations are normally active. Many persons are looking for a revival in business after the presidential nominations are over next week, as there is a strong feeling that the business interests of the country are not likely to suffer through a change in the fiscal policy. One of the encouraging signs from a lumber standpoint is an increasing demand for stock from the Eastern States. This is reported by the Lake Superior manufacturers, who are holding prices firmly on the ground that the amount of lumber to be produced this year will be no more than equal to the demand. There is especial firmness in No. 3 and 4 boards. The old stock of No. 4 boards has been entirely cleaned out, and there is a very light supply of No. 3. The decline in the price of Norway flooring has resulted in a heavier movement of that lumber. The weakest grade in pine is shop common, for which inquiries are very light.

Weakness is more pronounced in hardwoods than in pine. Business has been disappointing and stocks have accumulated to a greater extent than was believed possible two months ago. The country demand is lacking. The northern hardwoods, such as birch, basswood, elm, and maple, have declined about $1 per thousand feet, but are steady at the lower prices. Basswood has shown some improvement during the past week, but is still a slow seller, while birch is moving in larger volume.

GREAT BRITIAN.

There has really been no improvement in the British lumber market since last writing. The opinion is expressed that this season is likely to witness heavy consignments, is which case buyers would have no difficulty in being able to purchase anything they may require in reasonable quantities. The fear of such shipments is working against the market and shippers are, if anything, showing greater anxiety to close contracts, with a further shading of prices in some instances. At the recent public sales prices showed further weakness. Concerning spruce deals the Timber Trades Journal says: "The low c.i.f. offers that are reported in respect to spruce deals must be accepted in a qualified sense, and do not bear a full significance unless the specifications are taken into account. From what we can gather the market for 3 x 9 inch deals has not varied much from the position it stood in two or three months ago. Some depression has been experienced, and where shippers pressed sales they have had to make concessions. If what we hear is correct, there has been some slight improvement in the export trade during the past week or two, and from this holders are looking forward to a more active inquiry."

STOCKS AND PRICES.

The first of the season's log drives down the Moria river has begun to arrive at Belleville, Ont. It totals 25,000 pieces.

D. E. Sprague's log drive has started down the Red river for Winnipeg. It contains 6,000,000 feet. Mr. Sprague will also get 6,000,000 feet of logs from Rainy Lake by train.

Robert Aitken, who has been superintending driving operations on the Aroostook river in New Brunswick, has been successful in getting out all his old logs, about 9,000,000 feet.

It is estimated that 30,000,000 feet of saw logs will come down the Sturgeon river this season. J. R. Booth will drive 12,000,000 feet, Gordon Bros. 8,000,000 feet, the Victoria Harbor Lumber Company 8,000,000 feet, Cockburn & Son 2,000,000 feet, and the Nippising Lumber Company less than a million feet.

QUEBEC TIMBER LIMIT SALE.

A sale of Quebec timber limits took place at the Parliament Buildings, Quebec City, on Wednesday, June 22nd, Hon. S. N. Parent, Minister of Lands, Mines and Fisheries, presiding. Mr. P. Blouin, of the Department, acted as auctioneer. There were 1,716¾ square miles of limits disposed of, the total revenue amounting to $259,865.90. The following are the purchasers: McCormack & Co.—Lots 11, 13 and 15, range 3, 93 miles, on Upper Ottawa, at $91 per mile; range 4, Nos. 10 and 11, 100 miles, same price; range 5, Nos. 9, 10, 11, 150 miles, $130 per mile; lot 16, same range, 50 miles, $91 per mile.

Mr. Flood—Four miles, Grand Lake Victoria, at $1,100 per mile.

W. Hendrie—Nos. 603 and 604A, on Ottawa River, containing 8 miles, $501.

Mr. Ritchie—Forty-seven and a half miles at Bostonnais Island, on the St. Maurice, at $101 per mile.

Mr. Dupuis, M.P.P.—Back of River French, on the upper St. Maurice, 164 miles, at $156 per mile.

Mr. Grogan—Lot No. 13, Saguenay, 49 miles, $115 per mile.

Laferriere Lumber Co.—Lots 14 and 16, Saugenay, 60 miles, $130 per mile.

Manicouagan Export Co.—Lot No. 7, River Manicouagan, 50 miles, at $130 per mile.

J. C. Kaine—Three miles and three-quarters at Petit Bergeronnes, at $91 per mile.

W. H. Davis—Lots 1, 2, 3, on river Godbout, 60 miles, $135 per mile. Lots 1 and 2, on river Moisie, at $121 per mile.

H. M. Price—Nos. A and B, on the river St. John, North Shore, 68 miles, Nos. 2 and 3 on Salmon River, 115 miles, and 77 miles on the River Chambers, at $101 per mile.

M. K. Kean—Two miles and a half in new township Bonaventure West, range 9, nd five miles, range 9, at $201 per mile.

J. N. Piche—60½ miles in Canton Milenkek, at $135 per mile.

Lefebvre & Marr—5½ miles, Canton Marias, at $155 per mile, 3⅜ miles on River Andre, at $212 per mile.

Senator Edwards—30 miles on Grand Cascapedia River, at $155 per mile, 50 miles on Salmon River, at $185 per mile; branch 3, 35 miles, $190 per mile; branch 4, 15 miles, $205 per mile; branch 5, 18 miles, $215 per mile; 44½ miles, River Bonaventure, $153 per mile; 37¼ miles, River Bonaventure, $290 per mile.

W. Power—River Maepes, 2 2-5 miles, range B, Rimouski West, $201 per mile.

Mme. R. Blais—5¾ miles in Cabot township, Metapedia Valley, $151 per mile.

M. Guerette—Thirteen miles, range 1, Township Chabot, $201 per mile.

Wm. Milner—148 square miles on St. Anne River, Gaspe, $101 per mile.

Mr. Calhoun—Sixty miles, Sydenham West, Gaspe, $201 per square mile.

King Bros.—80 square miles, at Petit River Pabos and Grande River Pabos, $202 per mile.

BROOM HANDLES.

If an enterprising man with supplies of cheap Spruce, Basswood or Poplar care to put in several machines to work broom handles we cantake his output. Write in first instance to Empire, care of CANADA LUMBERMAN.

The saw and planing mill of John Atchison at Cornwall, Ont., together with 300,000 feet of lumber, was destroyed by fire on June 25. The loss is about $35,000 and there is said to be no insurance.

THE OTTAWA VALLEY.

(Correspondence of the CANADA LUMBERMAN)

OTTAWA, June 24th, 1904.—Comparatively little lumber is being shipped from the Ottawa district mills these days, either by rail or water. The English market is receiving but small shipments and nothing is going to the United States outside New York and district. About a score of lumber barges were here with coal this week, but only a very few could get lumber as a return cargo to the States.

High water in the Ottawa has interfered with the movement of lumber by barge. However, as the river is dropping to its normal level, the shippers are finding it possible again to work at the docks. Most trouble was experienced at Calumet and Rockland. At the latter point part of the yards was flooded and the tracks will need repairing.

It is likely that the high water will have the effect of reducing the season's lumber cut. The L'Original mills have only been running about half time and the Perley mill at Calumet and the Edwards Company's mill at Rockland were also interfered with by the high water.

Inquiry shows that Ottawa lumber prices are stationary, holding to the figures that have ruled all spring. Dullness is about the word that describes the lumber trade hereabouts at present.

The English market is quiet, so quiet in fact that considerable square timber that was cut for summer sale in the Old Country will be left on the limits until next season. Discussing the square timber end of the business, a leading operator said that present prices are not within eight to ten cents a foot as good as the prices at which sales were made last fall. Fraser & Company and Brennen & Company are two firms that have decided to hold over their square timber on account of the slump in in prices.

From present indications, and for the above reasons, there will be a big decline in the production of square timber next season.

It was persistently rumored recently that Mr. Thomas Mackie, M.P., had sold his newly purchased limits along with others at an advance of $100,000 on the price he paid at the December sale in Toronto. However, Mr. Mackie is purchasing horses and making other arrangements to work the limits himself, so that the talk of sale is groundless.

The high water in the Ottawa river caused a break in the Des Joachims dam above Pembroke lately. About 300,000 logs and pieces of pulpwood were liberated, and it was feared at first that great damage and delay would be caused by the distribution of the logs. However, the logs were all collected by the steamers of the Upper Ottawa Improvement Company within a few days. The company was favored in the work by natural conditions, a strong east wind holding the logs in place. The companies interested were J. R. Booth, W. C. Edwards Company, Hawkesbury Lumber Company, McLachlan Bros. and E. B. Eddy Company.

Reports show that all the log drives are coming along in fine shape and the firms will have to report but few logs as "hung up".

Charles Desmarais, of Hull, has a stock of cedar poles 25 to 60 feet in length at Mellon station on the Pontiac branch of the C.P.R. He is open for offers.

A lumber traveller returned from an American trip reports business in his line better throughout New York state than in the city itself.

WOOD PULP DEPARTMENT

BANQUET OF THE QUEBEC PULP WOOD ASSOCIATION.

The first annual banquet of the Quebec Pulp Wood Association was held in the Grand Central Hotel, Sherbrooke, Que., on May 31st last. Mr. H. M. Price, president of the association, presided, and had at his right Mayor J. O. Camirand and Mr. J. H. Walsh, general passenger agent of the Q.C.R., and on his left Mr. William Farwell, president, and Mr. James McKinnon, general manager of the Eastern Townships Bank. Among those present were:—Messrs. E. W. Tobin, M.P., B. A. Dugal, manager Bank National; F. N. McCrea, B. C. Howard, D. O. E. Denault, E. C. Gatien, E. Lagueux, L. S. Channell, L. A. Belanger, J. S. Tetreault, A. Gendron, J. A. Precourt, Sherbrooke; John Champoux, D'Israeli; D. H. Pennington, St. Julie. G. C. Poulin, St. Jean; O. C. Morrisette, Lake Megantic; C. C. Wilson, Lewiston, Me.; L. Bolduc and N. T. Turgeon, St. Francis; G. P. Nadeau, Stanfold; B. Quinn, Windsor Mills.

The toast of the King having been duly honored, Mr. O. C. Morrisette, of Lake Megantic, proposed the toast of the Quebec Pulp Wood Association, coupling with it the name of the president.

In reply Mr. Price stated that enquiry had often been made as to what were the objects of the Association, and he would state briefly the reasons why they had formed themselves into an association. They were joined together to promote the pulpwood interests in the Province of Quebec, by union and co-operation, and to impress upon the shippers that it was in their interests to ship nothing but pulpwood of the very best quality; to see that all contracts were observed, and that they got the necessary railway facilities. Mr. Price dealt with the shipment of pulpwood to the United States. It was apparent to everyone in the business that the United States was dependent to a great extent on Canada for its supply of pulp wood. From statistics with which he had been furnished, he found that the United States consumed about 2,000,000 cords of pulp wood, and from the same figures he found that Canada supplied about 400,000 cords. Canada shipped about the same quantity of ground pulpwood as in the cord. He was of the opinion that the whole of the pulpwood should be manufactured in Canada. He was a strong protectionist, and believed that all Canadians should be protectionists insofar as protecting their industries were concerned. If steps were taken to protect the pulpwood industry it would mean that capital would be brought into the country, and the pulpwood would be manufactured in our own country. He said that they should take every means to see that the wood which they contracted for should be of the full length. Complaints had been received in regard to this, and the sooner it was stopped the better.

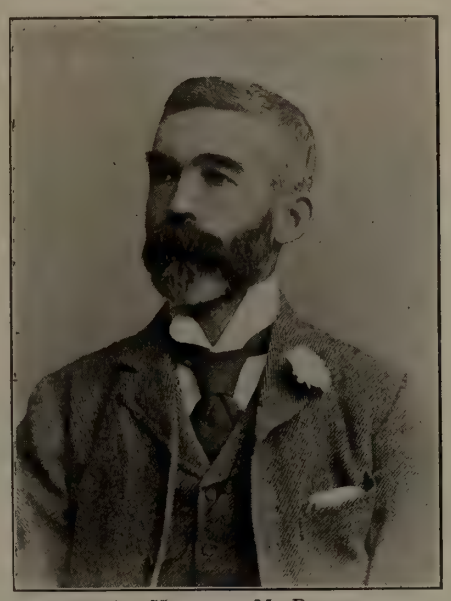
Mr. E. W. Tobin, M.P. for Richmond and Wolfe, spoke at some length on the pulpwood question as it was before the country to-day. He believed that they should join together, and sell their pulpwood f.o.b. on the cars. There had been a great increase in the pulpwood business during the past few years. While they might all be protectionists insofar as the lumber business was concerned, he believed that what they really needed was more capital. They were getting a good price for pulpwood to-day. The mills in Canada were getting $4 to $5 a cord, while in New York state it was selling for $11 a cord. He did not believe in an export duty on pulpwood, because if that were put on it would effect the farmers and settlers. Mr. Tobin suggested that the Association should take up the question of insurance, and if they worked together as an Association they would get cheaper rates.

Mr. F. N. McCrea proposed "Our Guests," and coupled with the toast the Mayor of Sherbrooke, Dr. Camirand, Mr. Wm. Farwell, and Mr. J. H. Walsh, General Passenger Agent Q.C.R.

Mayor Camirand referred to the great strides of the pulpwood business in the last twenty years. He always regretted to see so much pulpwood going out of the country, when it might be manufactured in this country if there was an export duty.

Mr. Wm. Farwell said that they had an available asset in their lumber lands. The people did not appreciate the value of the vast lumber interests in the country. He was a strong advocate of protection. He was in favor of absolute protection. This Canada was getting to be a big nation, and the only way they could build it up was to follow the example of their neighbors to the south of them. They did not want to be French, English, Scotch or Irish, but one people, and when they decided to be as one people then their country would increase and stretch from the North Pole to the Gulf of Mexico. If they had an export duty on pulpwood, and turned out the very best article, they would soon hold the market of the world.

Mr. J. H. Walsh said that the railways were in close



MR. HERBERT M. PRICE,
President of the Quebec Pulp Wood Association.

touch with and greatly interested in the pulpwood business. The shipment of pulp was a source of revenue to the railways. He was somewhat surprised at the figures given by the President in regard to the amount of pulpwood shipped to the United States. He thought he was safe in saying that of the 400,000 cords, half of that quantity went through Sherbrooke.

Mr. James McKinnon, general manager of the E.T. Bank, said it gave him great pleasure to be present that evening. He took issue with the figures presented by the chairman in regard to the quantity of pulpwood shipped to the United States. He had been informed by a leading railway man in Boston that fully 800,000 cords of pulpwood was shipped from Canada. He had been told by leading business men in the United States that the Canadians were fools to let so much go out of the country. If steps were taken to stop the export of pulpwood it would mean that American capitalists would have to come into this country.

PULP NOTES.

A company is being formed for the purpose of building a paper mill on the St. Anne river at Raymond, Que. The new mill will adjoin the pulp mill on the fine water power at that place now operated by McFarlane & Evans, of Montreal.

The preliminary surveys for the large pulp and and paper mills to be built at Fort Frances, Ont., by the American Power Company are now being made by W. L. Bowker, superintendent of construction for A. Nood & Company, a New York engineering firm. Minneapolis capitalists are interested in this project.

The employees of the Royal Paper Company, East Angus, Que., to the number of 300, went on strike recently, demanding their wages fortnightly instead of monthly. They also set forth a grievance against the superintendent of the mill.

The new pulp mill of J. R. Booth at Ottawa has commenced operations. It is a two-storey structure of concrete and brick, and is equipped with the latest machinery, the capacity being 70 to 80 tons of pulp daily. The total cost was about $150,000.

It appears that the English stockholders of the St. John Sulphite Pulp Company, whose mills are situated at Mispec, N.B., are determined to withdraw their capital and close up the business. It is said that local parties will acquire and operate the mill if satisfactory terms can be obtained.

The Quatsino Power & Pulp Company, for whom 100 square miles of pulp lands lying between Quatsino and Broughton Strait, in British Columbia, were reserved two years ago, are preparing for active operations. They have already selected their pulp areas, and are about to let a contract for the erection of a wharf, saw mill and pulp mill on the narrows of Quatsino Sound. It is intended the saw mill shall have a capacity of 40,000 feet per day, while the pulp mil will produce about 70 tons daily. The estimated initial expenditure will run about $130,000. As soon as the plant is thoroughly under way, and business warrants such a step, they purpose erecting a paper mill. The company has a total working capital of $500,000

W. A. Bauer has been commissioned by the Oriental Pulp & Power Company to survey 22,200 acres of timber land on the coast of British Columbia, which will finish all the surveys of the company's lands and make the concession from the government complete. Work in connection with the construction of the pulp and paper mills at Swanson Bay is progressing steadily. The location is on the mainland, opposite Princess Royal Island, and is admirably suited for this purpose. There is a never failing source of water supply, furnishing 15,000 horse power from Yule Lake. This has been tested at all times of the year, and that amount of power is the minimum. The timber to be used is all located in the vicinity. J. M. Mackinnon, of Vancouver, the local representative of the Canadian Finance Syndicate, of London, of which the Oriental Pulp & Paper Company is a subsidiary organization, states that $100,000 has already been expended. The ultimate expenditure will be $900,000. The works will be very large, and the company has already secured 500 acres for a town site surrounding the location.

THE Wood-Worker and Retailer

AMERICAN NO. 45 AND NO. 46 DOUBLE SURFACERS.

The accompanying illustration shows a late improved machine brought out by the Hoyt & Brother Company Branch of the American Wood Working Machinery Company built from new patterns and claimed to contain every late improvement essential for surfacers for planing mill and box factory work. It is built in two sizes to work 26 or 30 inches wide, and from ⅛ inch to 8 inches thick. Stock as short as 12 inches in length can be readily surfaced.

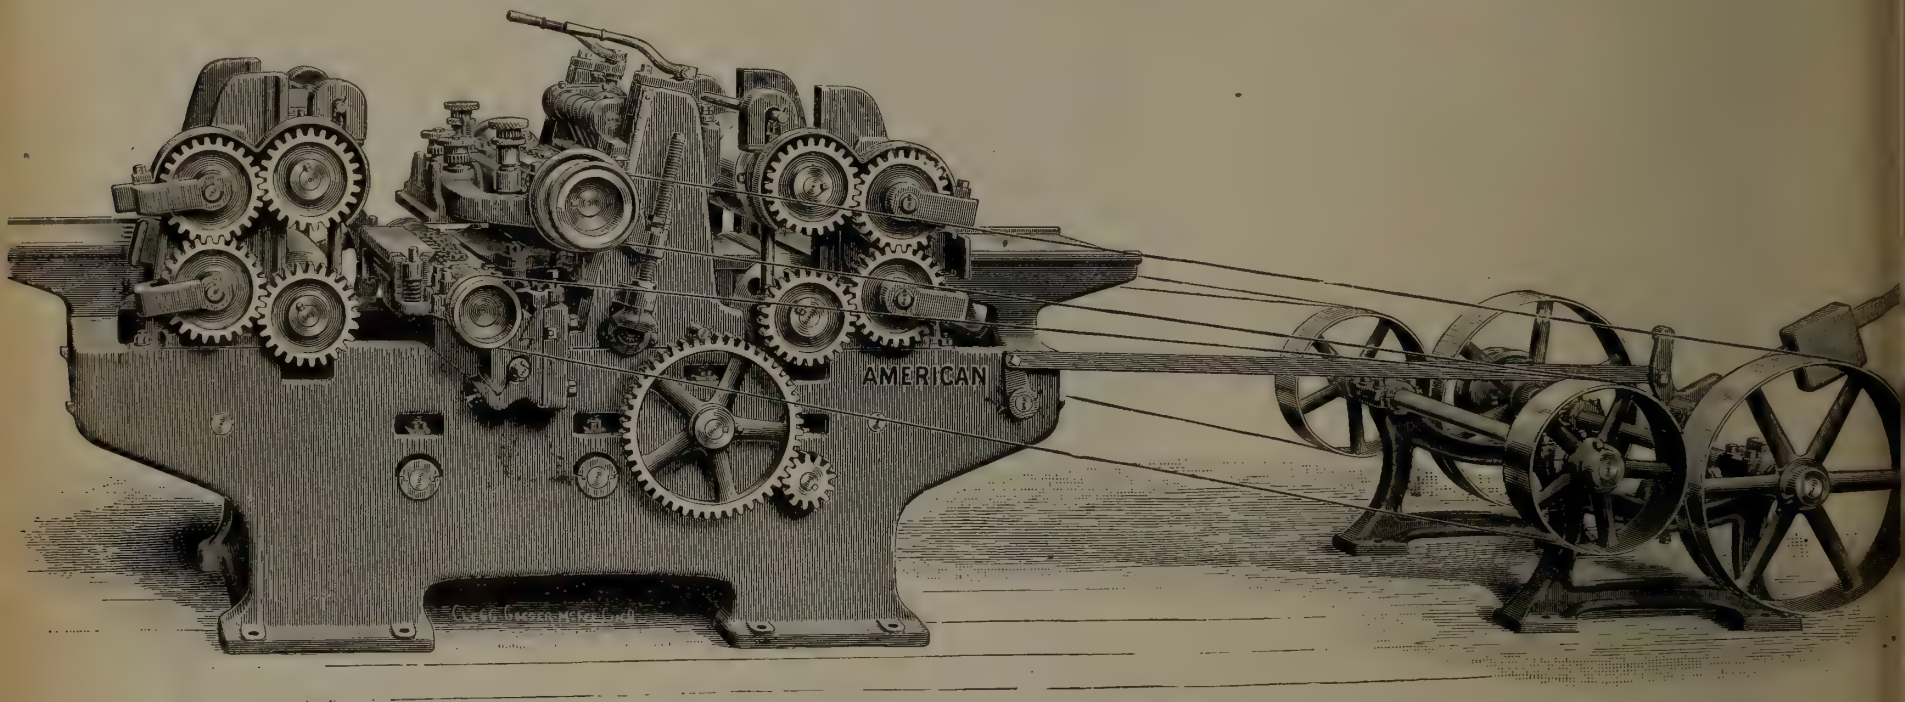
The frames are heavy and substantially ribbed, combining attractive design with strength and durability. The feed consists of four rolls, powerfully geared, with heavy pressure and fitted with parallel lift. The top in-feeding roll is divided into six sections, so arranged internally that while they are all placed on a straight shaft, they have singly or combined the feeding power of a solid roll, yet each section will yield to the uneven thicknesses of the boards. Six pieces of lumber varying in thickness may be fed to the machine at the same time, with perfect pressure on all. The sectional rolls are simple in construction, yet very powerful.

The top and bottom cylinders are of hammered crucible steel and are interchangable, carrying two knives. The journals are large in diameter and run in long self-oiling boxes. The boxes are yoked both in front and behind the cut, making it impossible for them to get out of alignment. The upper cylinder yoke is easily, quickly and firmly clamped by means of hand levers. This clamping device provides for the quick correction of lost motion. The lower cylinder draws out on the operating side of the machine.

All driving gears and pinions are mounted on shafts which run in self-oiling boxes. They are heavy and strong with wide faced teeth, allowing a wide range of feed. The regular rates of feed are 40, 50, 60 and 80 feet per minute.

In addition to the above double surfacers, the American Wood Working Machinery Company have also recently produced two other new double surfacers of the same class as the above but varying materially in design and construction. These three new double surfacers were brought out to meet the demand of various operators in the different sections of the country.

To any of our readers who are interested in double surfacers, we recommend them to write the above company and obtain from them full detailed information regarding the construction of these machines. For prices on these or any other wood-working machinery, we would refer our readers to the American Wood-Working Machinery Company, 136 Liberty Street, New York City, or The Fairbanks Company, Vancouver, B.C.



AMERICAN NO. 54 AND NO. 46 DOUBLE SURFACER.

MANITOBA AND NORTHWEST LETTER.

Office of the CANADA LUMBERMAN,
McIntyre Block, WINNIPEG, June 2 th, 1904

The state of agitation in the lumber trade which has been existent in Winnipeg and the Northwest Territories for some time past is nowsomewhat subsiding and is being replaced by a more moderate spirit,and there is apparent, especially on the part of the older and more experienced men, a manifest disposition to lay hold of the situation in a resolute and open-minded manner.

That the prevailing conditions in these industries are anything but satisfactory is an open secret, but to relieve those conditions and establish a basis which will satisfy the demands of all concerned and be at the same time conciliatory and just,is a task at once onerous and delicate, requiring a thorough knowledge of all the varied conditions which have arisen and are the outcome of the extraordinary growth and expansion of the Dominion and for which we were as much unprepared as they were unexpected.

The lumber camp, heretofore, has been to a large extent the great "pioneer" of civilization, and others have followed in its wake, finding lumber in abunbance and ready to hand. The questions, therefore, which are now arising are to a large extent comparatively new to the situation. The opening up of vast tracts of prairie lands and the mad rush of the thousands of pioneer farmers, is a condition which could scarcely have been foreseen, much less provided against, and it is not to be wondered at if it found us unequal to cope with the new conditions, either as regards transportation, or supplies, or both. The rush is only in its infancy and it is sincerely to be hoped that the weapons of war will be laid aside and the "battle" as to "who is to blame" forgotten, and each party give its attention as to how best to meet these new conditions.

Towns, villages and farms are springing up on all sides; their first demand is for lumber, and it is their continued call right along. It is therefore of greatest importance that this industry should be on a thoroughly equitable basis, in fact it passes from the ranks of importance of "an industry" into that of "national" importance. Settlements are stopped, the growth of towns checked and the whole advancement of the country jeopardized, where lumber is not readily obtainable.

That these conditions are fully understood and appreciated by the lumbermen is without question, and is clearly evidenced by the activity of the secretaries of the Lumbermen's Associations. The importance of the dealers carrying sufficient stocks to amply meet the demand of their respective districts has been continually before the Western Retail Lumbermen's Association, and their Secretary, Mr. Isaac Cockburn, has left no stone unturned to accomplish this end, and we believe that never before have the stocks in the districts been in such satisfactory shape as they are at the present moment. This has not been accomplished without a good deal of hard work; dealers had to be approached, and the probable requirements of the varied districts carefully estimated, correspondence and transportation difficulties negotiated with the greatest tact and care; and all this too in such a way as not to unnecessarily increase the existing prices.

The question of transportation must unquestionably take precedence as the most serious difficulty, and upon it to a large extent the whole situation rests. That it is an "honest difficulty", and not—as many would have us believe—the outcome of culpible negligence, is freely acknowledged by all who have given it

FOR THE CAMP—

We have a very suitable lot of goods for camp supplies. We make this kind of trade a specialty. You who are not getting suited just as well as you would like, try us for your next order, and give us a chance to demonstrate our ability to give you satisfaction in this very important department of your business.

H. P. ECKARDT & CO.

Wholesale Grocers - - TORONTO

careful thought. It is a difficulty in which lumber does not stand alone, but which is just as real in other lines. We can and do give to the C.P.R. the greatest consideration and sympathy, and believe that they are perfectly frank and honest in their endeavors to meet the situation. We know that mills have sprung up on every hand, just as the opportunity arose, and mainly at the judgment of the lumberman, and of necessity without, very often, serious consideration being given to the railroad. For every mill thus started the question becomes one, not only of additional transport demand, but the company are also face to face with the problem of landing sufficient empty cars at such places to meet the demand, which may often mean transporting empty cars several hundred miles in order to collect a cargo, and we doubt not this accounts for, in great measure, the apparent heavy freight charges; with the further difficulty that cars are often consigned to points where it is impossible to obtain return cargoes. That these are real difficulties and not imaginary, must be palpable to all who have had to do with transport arrangements, even in a limited way.

There are other difficulties, such as the make up and weight of a train, which perhaps have more to do with "time" than "charges", and which we merely mention as being part of the necessary organization. The cause, however, which has led up to and is responsible for the present state of things, is without doubt the abnormal expansion of Manitoba and the Northwest Territories, an expansion which, there is every reason to anticipate, will not only continue, but increase with still greater proportions. It is evident, therefore, that in the interests of the Dominion at large, the present transport conditions "ought" to receive the immediate atttention necessary for the relief of present conditions. That it "can" be done is the candid belief of all well informed business men. That it "must" be done is the unanimous voice of all concerned.

It is not within our province to attempt to run the transport companies of the Dominion, but we fail to see what benefit could possibly accrue by the C.P.R. or any other transport company entering the field of competition, now already large, in the lumber industries, when the real question is one of "delayed" or "congested" transport and by no means that of lack of supply.

Attention has been directed to the Western Retail Lumbermen's Association, and exception taken to its wide-spread influence. It has been established many years and has been the means of cementing the interests of the various branches of the lumber trade, and it appears to have done an excellent work in raising the tone and conditions of the industry from start to finish. And, as far as we can gather, could never at any time be considered as a combine, or for the controlling of price. That it should at the outset have guarded its membership is not to be wondered at when due consideration is given to the fact that, at that time, the trade looked well like being overrun by irresponsible men, who were neither good for credit nor capable at the business, and it became a serious question to the manufacturer to carry such men over from season to season, as had to be done. Probably these conditions are not now existent. There is full evidence of the continual addition to the ranks consequent upon the opening up of new opportunities, which tend to prove that the Association is well alive to the present situation.

The question of price always has been, and we suppose always will be, a proposition involving much peculation, and must inevitably fall back upon the question of supply and demand, and no power on earth can prevent an advance in prices when requirements are exceeding the supplies. In lumber, however, this is only the case where bad transport facilities exist. The supply of lumber at the present time is in abundance, and consequently prices are fluctuating against sellers. This is a circumstance much to be regretted, as recent prices do not appear to have been in any way excessive. The decline has been brought about more by the undue activity of American competition than by anything of a legitimate nature.

There seems to be no attempt on the part of American manufacturers to hold prices, and sales are being effected for manufactured stuff at prices little higher than Canadian logs, and in a certain instance just recently where competition was invited and the preference would have been given to the B.C. mills if possible, the U. S. prices were such that there remained no choice, and the cargo was delivered in Winnipeg having travelled C.P.R. via Sumas, the B.C. mills finding it impossible to meet prices.

A stronger argument for protection could not possibly exist, conditions as to freight, etc., being on about an equal basis.

The C.P.R. have placed some large orders with the Mountain mills for lumber, particularly in connection with their maintainence department, which will relieve the situation somewhat so far as these particular mills are concerned.

The Red Deer Lumber Company, Limited, which was incorporated last year, have opened offices in the Forum block, Main Street, Winnipeg. Their mills at Barrow have just been completed and put in operation. They will have a capacity of 1/4 million feet per day. They have a two band mill and a resaw, and every detail of machinery and arrangement is of the most modern style. It is believed to surpass any mill yet erected in Canada. They are now right down to business and expect at no distant date to have some forty million feet on stock.

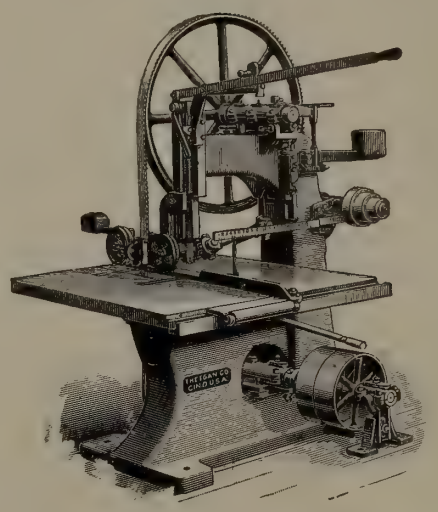
NEW BAND RIP SAW.

If any of our readers have ripping to do, the new machine here shown will prove very interesting. Its makers claim it will surpass in quality and output anything in this line they are now using, and for ripping fine lumber it is far in advance of other models of this character, as it represents an entirely new departure in band ripping. The manufacturers claim that competitors, recognizing the merits of this machine, are everywhere copying it, but in all cases the "copy" is a dismal failure, so that legal processes are not even necessary. There is no other like it, and it has met with unqualified success wherever installed, as attested by many letters of testimony received from users, who praise its merits in the highest terms. Copies of these letters can always be had on demand, as it is the policy of the makers to prove, as far as possible, any claims they may make about their machines.

The machine was patented February 27th, 1900, and October 2nd, 1900. It will do either light or heavy work, cut short or long pieces, and work either soft or hard wood, with no possibility of danger to the operator. Circulars should be sent for in order to grasp all its features. The thin saw blade will save an amount of kerf that will be readily appreciated by all workers of fine lumber, and will ultimately pay for the machine itself.

The straining device, with knife edge balance, insures at all times an even tension on the saw blade, a thing so necessary to prolong its life, and still so seldom found.

The solid lower wheel prevents vibration, receives increased momentum, and precludes the possibility of



No. 1 Automatic Band Rip Saw.

overrunning the upper. By a single movement of a lever convenient to operator, the machine is changed from a self feed into a hand feed rip saw; and where flooring is made in large quantities, is fitted with a long table on which are rolls for quickly returning the material. The feed rolls are placed close together, so that short work can be cut with facility.

The makers, J. A. Fay and Egan Company, Cincinnati, Ohio, will willingly furnish further particulars. To those interested who will write mentioning this journal, they will send free their new illustrated catalogue of wood working machinery.

Corrugated Iron

For Sidings, Roofings, Ceilings, Etc.

Absolutely free from defects—made from very finest sheets.
Each sheet is accurately squared, and the corrugations pressed one at a time—not rolled—giving an exact fit without waste.
Any desired size or gauge—galvanized or painted—straight or curved.

THE NEWS

ONTARIO.

—William Clegg & Son are building a new planing mill at Stratford, Ont.

—D. Anderson has installed new machinery in his saw mill at Waverley, Ont.

—The Manitoba Lumber Company's new planing mill at Emo, Ont., is now in operation.

—Hugh Richardson & Company, Elora, Ont., are installing new machinery in their planing mill.

—The Dyment-Baker Company are making alterations and additions to their planing mill at London, Ont.

—W. C. Crawford, of Tilbury, Ont., has increased the capacity of his plant for producing turned wooden goods.

—The Sutherland-Innes Company, of Chatham, Ont., have commenced the erection of a cooperage stock mill at Thamesford, Ont.

—The Northern Land and Lumber Company, Port Arthur, Ont., have just installed a large dry kiln in connection with their mill.

—The Severn Bridge saw mill of Mickle, Dyment & Company has been thoroughly overhauled and a new double cutting band installed.

—The Midland Steel Works, Midland, Ont., have just built a new burner for the Georgian Bay Lumber Company's mill at Waubaushene.

—Foreman Ludgate took out during last winter 6,700,000 feet of logs for the St. Anthony Lumber Company, a large cut for one camp.

—C. L. Foiler, New Hamburg, Ont., has installed a complete planing mill outfit, supplied by the Levy, Weston & McLean Company, of Toronto.

—While working on McKleish's drive for the Turner Lumber Company, Walter Eldrich, aged 24 years, fell over the dam near Pickerel Lake and was drowned.

—The Stratford Chair Company are about to build a large chair factory at Stratford, Ont., the main building of which which will be 60 x 100 feet and three stories high.

—While working on a boom of the Rainy River Boom Company, four miles up the river from Rainy River, Ont., Charles McArthur slipped off a log and was drowned.

—The Ontario Government will receive $60,000 succession duties from the estate of the late William Mackey, lumberman, of Ottawa, which is valued at $267,000.

—By coming in contact with a circular saw while working at Briscoe's saw mill at Admaston, Ont., a young man named Stearns had one of his hands taken off at the wrist.

—The business of J. B. Smith & Sons, lumber dealers and woodworkers, Toronto, has been transferred to a new company, known as John B. Smith & Sons, Limited. The incorporators are J. A., Robert, William J. and James H. Smith, and John Thom. The share capital of the company is $400,000.

—The Northern Land and Lumber Company, Port Arthur, Ont., have purchased Sterritt's saw mill at Hymers, Algoma district. This will give the company two mills on the Duluth extension.

—The Digby Lumber Company Limited, has been incorporated, with a capital of $25,000 and head office in Toronto. The directors are Archibald Kidd and F. H. Kidd, of Toronto, and F. A. McDiarmid, of Fenelon Falls.

—M. L. Dunham, of Toledo, Ont., has purchased the Sam Running saw mill property, and will take possession on November 1st next. He intends overhauling the mill and installing a veneering machine for the manufacture of cheese box material.

—Jackson & Son, lumber merchants, Petrolea, Ont., have disposed of their planing mill, stock of lumber and business good will to J. & J. Kerr Company, whose mill was burned recently. The purchasers will install new machinery and make other improvements.

—The St. Anthony Lumber Company are hauling 2,000 logs daily to Whitney over their Opeongo railway. The logs are loaded at the Great Opeongo Lake, where two steam hoists are in operation. These hoists load eleven cars in one hour and a half.

—The Carney Lumber Company, who recently bought 200,000,000 feet of pine timber on the Spanish river, are figuring on a location for their sawmill, which will be moved from Marinette, Wis. Collingwood and Owen Sound are spoken of. The logs will be towed from the mouth of the Spanish river at Massey to the mill.

—The Ontario Government has decided to construct a canal between the upper waters of the Sturgeon river and Wahnapitae lake with a view to facilitating the transportation of logs. The distance is about one-third of a mill. It will then be possible to get the logs out to Lake Huron in one season, whereas two seasons are now required.

—A shocking accident occurred recently in the Parry Sound Lumber Company's mill at Parry Sound, Ont., whereby Robert Tuck lost his life by coming in contact with a saw. He was engaged as edger and was endeavoring to loosen a hook which had got fastened, evidently without thinking that he was fast travelling towards the saw, which completely severed his head from his body.

—A company known as the Northern Timber Company, Limited, has been incorporated by the Ontario Government. The capital is placed at $100,000 and the head office will be in Toronto. The incorporators include A. H. Vanderburgh, accountant; W. H. Gilchrist, bookkeeper; C. W. Bennett, mill superintendent; W. J. Martin, mill foreman; and R. H. Parmenter, barrister, all of Toronto.

—In the action of the Bank of Montreal against Mr. J. J. C. Thomson, of Hamilton, for $40,000 in connection with the winding-up of the estate of the late Mr. Robert Thomson, of which the defendant is executor, and for which sum the bank claimed the defendant was personally liable, the local Master gave judgment in favor of the defendant. The defendant's contention was that the debts in question had been contracted by the testator.

THE EASTERN PROVINCES.

J. G. Elliott, saw and planing mill, Shawville, Que., recently suffered a loss by fire.

—The Forest Exploration and Lumber Company, of Montreal, has been organized by R. A. Klock.

—The Scott Lumber Company have installed an electric plant for lighting their Victoria mill at Fredericton, N.B.

—M. J. Collicut, of Elgin, N.B., has secured a contract to saw this season at Millstream for the Sumner Company, of Bathurst.

—The Inglewood Pulp and Lumber Company and White, Fownes & White have their saw mills at Musquash, N.B., in operation. J. P. Mosher is in charge of the mill of the latter company.

—Gilmour & Hughson, Limited, Hull, Que., are asking for tenders for the purchase and removal of the old water saw mills formerly the property of Gilmour & Company, Gatineau Mills, near Chelsea, Que.

—Joseph Lacombe, of Montmagny, Que., and Joseph Guilnette, of St. Raphael, Que., were drowned on May 27th, while driving logs on Riviere du Sud for Price Bros. & Company. The former was married and father of a large family.

—A Swedish syndicate, including O.W. Nordien, W. Vording, and P. C. Waern, jr., have purchased the Lawrence Doyle saw mill at Rosebank, N.B., at a price said to be in the neigborhood of $8,000. It is said to be the intention of the purchasers to install new machinery with an increased capacity.

MANITOBA AND THE TERRITORIES.

—A planing mill is being built at Melita, Man., by Morley & Badgely.

—W. Oliver is building a planing mill at Lethbridge, N.W.T. It is of brick, 47 x 52 feet.

—The Imperial Elevator Company have purchased A. Sinclair's lumber yard at Wapella, N.W.T.

—The Regina Planing Mill and Supply Company, Limited, Regina, N.W.T., has been incorporated.

—The Northern Lumber Company's saw mill at Pine River, Man., is being removed to the Woody River. The timber supply for the mill will be obtained from a limit in the Porcupine Mountains.

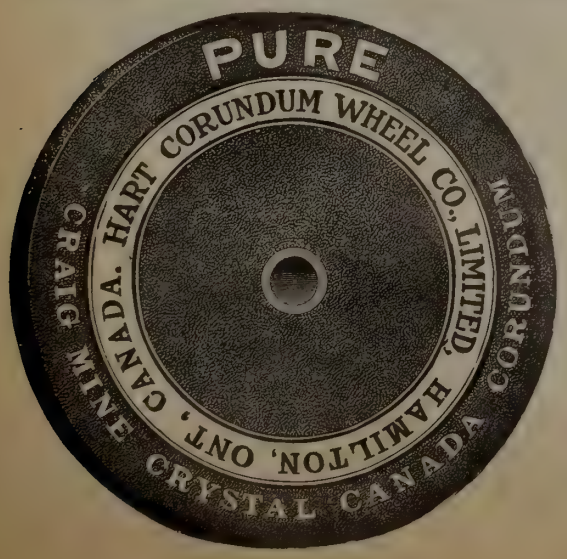
—A licence has been granted to the Menz Lumber Company, a Minnesota concern, to do business in the province of Manitoba. James F. Ross, of Winnipeg, has been appointed principal agent for the company.

—The Regina Planing Mills Company, Limited, are about to build at Regina, N.W.T., a planing mill and manufactory of sash, doors, mouldings, etc.

—Capitalists of Carman, Man., have commenced the erection of a large saw mill on the south shore of False Creek at Vancouver, B.C., where they have secured an excellent site with water and rail transportation facilities. It is said that the mill will have a capacity of 100,000 feet per day and that it will be under the management of Mr. Smith, formerly foreman at Mc Nair's saw mill.

—A Dominion charter has been granted to the Digby Lumber Company, Limited, of Winnipeg, with a capita-

CRAIG MINE CRYSTAL CORUNDUM WHEELS



Our Pure Crystal Corundum Saw Gummers have no equal for their rapid, cool, cutting properties.

Read the following from Bulletin 180 of the United States Geological Survey, which says:

"Often a distinction is made between emery and corundum, many persons not recognizing emery as a variety of corundum.

Emery is a mechanical admixture of corundum and magnetite or hematite. It is, of course, the presence of corundum in the emery that gives to it its abrasive qualities and makes it of commercial value, and the abrasive efficiency of emeries varies according to the percentage of corundum they contain."

Emery is imported, mined by Greeks and Turks and contains only about 25% corundum. Our Crystal Corundum is guaranteed to be 98% pure alumina, a Canadian product, mined and manufactured by Canadians for Canadians.

HART CORUNDUM WHEEL COMPANY, Limited, Hamilton, Ont, Can.

of $200,000. The promotors of the company are R. E. Banbury and R. S. Banbury, lumbermen, of Wolseley, N.W.T., and J. A. Johnston, lumberman, R. W. Gibson, financial agent, and G. H. Davis, barrister, of Winnipeg. Power is granted to acquire and deal in timber limits and to manufacture lumber, pulp, etc.

BRITISH COLUMBIA.

—The Yale Lumber Company will shortly build a saw mill at Midway, B.C., on the mill site formerly owned by W. Powers.

—The Kamloops Saw Mill Company, Kamloops, B.C., has been succeeded by the Kamloops Lumber Company, Limited.

—The Vernon Saw and Planing Mill Company, Vernon, B.C., have just added extensive additions to their property at a cost of $21,000.

—The Yale Columbia Lumber Company purpose putting in a band mill at Robson, B.C., thereby increasing the capacity to 75,000 feet per day.

—The A. J. Burton Saw Company have their new works at Vancouver, B.C., nearly completed. They have installed a 50 horse-power electric motor.

—The North Pacific Lumber Company, of Barnet, B.C., purpose fencing in their entire property at a cost of $700. The fence will be three-quarters of a mile long.

—The Kamloops Lumber Company and the Okanagan Lumber Co. have joined hands under the title of the Kamloops Lumber Company, with a capital of $500,000.

—Last year's lumber trade disbursed in British Columbia a total of $9,000,000. In addition to this the C.P.R. took $3,000,000 as freight charges for hauling the lumber east.

—The shingle mill of Grady, Owman & Carlson at Morrissey Junction, B.C., is now completed and has a capacity of 1000,000 shingles. The firm purpose building a saw mill also.

—The Hunting & Lea Lumber Company, operating a saw mill on False Creek, Vancouver, B. C., have leased the recently built Chisholm mill on the inlet to the west of Heaps' mill.

—The Vancouver Lumber Company, Limited, have succeeded the Urquhart Mills, Limited, operating the old Leamy & Kyle saw mill on the south shore of False Creek, Vancouver, B.C.

—George McCormick, M.P. for Muskoka and Parry Sound, intends moving his family to British Columbia, where he is interested in the Kamloops Lumber Company and the Okanagan Lumber Company.

—The D. Adams Lumber Company, owning a small mill in Victoria with a capacity of 10,000 feet a day, have definitely closed down, the machinery and property being placed on the market for sale.

—Andrew Haslam, whose saw mill and sash and door factory at Nanaimo, B.C., were destroyed by fire last month, commenced building operations immediately and expects to have a modern plant in every respect.

—The Chilliwack Shingle Company's intention to build a new saw mill for the manufacture of clear cedar at Harrison River, B.C., has been abandoned for the present, pending improvement in the market and tariff adjustment.

—The Hastings Shingle Manufacturing Company are operating the small mill erected at Moodyville. In close proximity to the mill site the company possess large limits of high class cedar, the mill being erected to be devoted exclusively to this trade.

—Robert Tom, of Spokane, Wash., representing the American Logging Company, was cruising at the headwaters of the Nanaimo river when, on June 6th, his foot was accidently split open by an axe while chopping. He was carried by his men on a litter all the way to the hospital at Nanaimo.

—In common with the usual custom of prosperous mining companies, the Yoeka Copper Company, operating the Comstock Group in Quatsino Sound, and the Tyee Copper Company, of Mount Sicker, have both built saw mills to supply their necessary requirements in timber and props.

—The Empire Lumber Company, of Revelstoke, B. C., purpose building a two-band saw and shingle mill one and a half miles west of Comaplix, with a capacity of 150,000 feet of lumber per day. They expect to have the mill completed by the end of this year. The total cost will be about $175,000.

—Extensive alterations and additions are nearly completed at the Cook & Tait mill on False Creek, Vancouver. The addition consists of a two-storey building, 36 by 180 feet, in which is being placed saw mill machinery by the Waterous Engine Works Company, Brantford, Ont. The new plant will have a capacity of 50,000 feet a day.

—Grant & Kerr, of Ladners, B.C., have made vast improvements and additions to their mill property. They have erected a new dry kiln 64 by 20 feet and 14 feet high, with a capacity of 10,000 feet of lumber, a water tank with a capacity of 9,500 gallons, and a sash and door factory. The water tank is placed at the top of a huge tower 5 feet above the peak of the mill.

—A new dry dock for Vancouver is being erected in England by Swan & Hunter, on the Tyne. It is to be of the floating variety, with an inside length of 500 feet and a width of 100 feet, giving accommodation to vessels possessing 11,000 tons displacement. The dock and equipment, it is estimated, will cost the C.P.R. $1,000,000. Preliminary work is now going on at N. Thompson & Company's works, Vancouver.

—The log-towing business on the Pacific Coast is of large proportions. The tug St. Clair, in one week recently, towed into Vancouver from points up the coast about 3,000,000 feet of logs. One tow, which comprised twenty-four "swifters," was measured at 1,700,000 feet and the other at over 1,200,000 feet. It is said that 1,900,000 feet was the largest single raft ever brought into port by a tug on British Columbia waters.

—The Summerland Supply Company, of Summerland, B.C., whose saw mill was destroyed by fire recently, are building a new mill with a daily capacity of 20,000 feet. The power is to be generated from the water of Trout creek, a distance of five miles from the lake, the water being carried in flumes through a tunnel in the mountain to operate the turbine wheel at the mill.

—It is reported that an Ontario syndicate is about to build a large saw mill in British Columbia for the manufacture of ties to be used in the construction of the Panama Canal. The promoters, who have been working quietly, are said to have secured a large area of timber limits and purpose establishing their mill at Vancouver. The business will be confined entirely to export trade. The name of Senator George A. Cox, of Toronto, has been mentioned in connection with the project.

—The firm of Woods & Spicer, Limited, Vancouver, B.C., have just extended their main building 110 ft. by 12 ft., and entirely remodelled their dry kilns, doing away with the hot blast system and substituting the natural draft in exchange. They have also installed two additional shingle machines, made by Letson & Burpee, for the manufacture of special sized shingles. The estimated cost of these improvements is $4,000.

—The firm of Robertson & Hackett, Vancouver, B.C., have just completed some improvements to their mill at a cost of $12,000. A new siding has been built and the shipping platform has been widened 14 feet, the dimensions now being 36 by 100 feet. All the old dry kilns and sheds have been removed and replaced with new ones, the new kilns being constructed of solid wood, without any air space. The boiler house has been entirely reconstructed upon fireproof lines, of brick with iron roof, while all the refuse is now ground up through a hog grinder and used for the boilers, a strong element in the fire line being thus eliminated.

—The Taylor Mill Company, of Victoria, manufacturers of sash, doors, lumber, etc., are doing a very extensive business throughout the local market. The mill, built in 1884 and owned by Johnson, Walker & Flett, passed through many a stormy day until it was purchased by its present owners in 1891. Under the able care of Mr. McCarter, the superintendent, the capacity has been increased to 25,000 feet daily, while present indications give promise of a still further increase being necessary in the near future.

—The firm of Lemon, Gonasson and Company, Victoria, are adding extensive additions to their already large plant. These include a planing mill, already complete and running, and a large saw mill, the latter to have a capacity of from 25,000 to 30,000 feet daily. It is not intended to seek for export trade, as the output will be used up in supplying material for their large sash and door factory. The mill site is splendidly situated on Rock Bay, having a frontage of 31 feet, and running back for a distance of 120 feet. The machinery consists of two boilers 66 × 16, engine 16 × 20, and general saw mill machinery, and was supplied by the B. R. Seabrooke Machinery Company, a local supply house. A splendid matcher is being put in by McGregor, Gourlay & Company, of Galt, Ont.

—The Burrard Inlet Flume and Boom Company have completed, at a cost of $25,000, their large flume in the Capilano Valley, immediately west of the Capilano River. It commences at the upper end of the canyon on the river somewhere about three-and-a-half miles from tide water, and extends up the valley for three-and-a-half miles. It is built out of 1½" lumber, and is shaped with sides 24" deep. The flume will be utilized to carry timber down and dump it into the river, from which point it can be easily carried down to tidal waters and shipped to various points. The company, under the River and Streams Act of the Provincial Government, have secured exclusive driving rights on the Capilano River.

MERITS OF MOULDERS.

Editor CANADA LUMBERMAN:

Dear SIR,— I wish to ask through the columns of The LUMBERMAN as to the relative merits between a roller feed and revolving bed moulder. The one bad feature with the roller feed is in taking a light cut the rollers mark the lumber and the stock will not show until oiled or painted, and in running a four sided machine the feed rollers must be weighted down. What are the defective points with a revolving bed that they are not more popular?

Yours respectfully,
"J. S."

PERSONAL.

Mr. C. D. Warren, president of the Imperial Lumber Company, Toronto, has been elected president of the reconstructed Consolidated Lake Superior Company, of Sault Ste Marie.

Miss Dunella Rathbun, second daughter of the late E. W. Rathbun, of Deseronto, was married last month to Mr. H. Jones, assistant manager of the Bank of Commerce, London, Eng. The wedding was quiet.

THE LUMBERMAN was pleased to receive a call recently from Mr. D. J. Crowell, inventor and manufacturer of the Crowell saw swages. Mr. Crowell states that his sales of swages to Canadian millmen are steadily increasing.

Among those who have visited the St. Louis Exhibition is Mr. Peter Whelan, manager at Ottawa for the Shepard-Morse Lumber Company. Mr. Whelan speaks in the highest terms of the big fair, and states that he was especially proud of the Canadian building and its exhibits.

OUR WINNIPEG BRANCH.

The publishers of this Journal have recently opened a branch office at No. 310 McIntyre Block, Winnipeg. A resident representative has been appointed who will be exclusively employed in advancing the circulation of this Journal and in keeping our readers informed regarding the latest developments throughout the West. The kind co-operation of our friends in the west is solicited in behalf of the success of this enterprise.

NOTES.

The Stuart Machinery Company, of Winnipeg, are supplying planing mill machinery for Hughes & Company, Brandon; Robinson & Company, West Selkirk; and G. W. Murray, Winnipeg.

Mr. Nelson Winlow is extending the main building of the saw mill at Winlow Siding, Slocum Valley, B.C., 25 feet in width and 60 feet in length. Much new machinery is being installed, including an automatic carrier to carry the lumber from trimming saws to planer, and a new carriage. He is also building a new dining room and bunk house for his employees.

The new mill being built for the Rat Portage Lumber Company at Harrison River, B.C., is rapidly approaching completion. It occupies a site of 26 acres on the site of the old mill of the Harrison River Milling and Trading Co. When completed the plant will consist of a saw mill, shingle mill, planing mill, and sash and door factory. The saw mill is 308 feet long by 66 wide, with a wing attached 40 × 120 feet. It is to be equipped entirely with gang and band saws, no circulars being used at all. While it will contain all the latest specialties, the double cutters it is intended to install will be entirely different from those used on the coast or in British Columbia generally, as they will handle both round timber and cants. The estimated cost at completion, said Mr. F. McCrea, the manager, will be easily $175,000, while the capacity will be 120,000 feet of lumber and 100,000 shingles per day of 10 hours. It is intended that the output shall be increased to 200,000 feet of lumber per day as soon as trade demands it, there being power enough to enable the company to effect this increase. The plant will be lighted entirely by electricity.

Makes Men Good-natured

THE HANCHETT ADJUSTABLE SAW SWAGE

For all Sizes and Kinds of SAWS—CIRCULARS, GANG, CYLINDERS, BAND RESAW and BAND SAWS.

BECAUSE The Hanchett Swage is the Best Swage It Saves the Saw Blade, Files, Time and Labor

By the action of the dies the teeth are drawn out, which not alone refines the steel, causing the saw to hold a better cutting edge, and prevents crumbling and splitting of teeth, but at the same time increases life of saw from 20 to 30 per cent.

The Adjustments are perfect, and are quickly and easily made.

Hanchett Swage Works, Big Rapids, Mich, U. S. A.

SCHAAKE MACHINE WORKS.

The above firm are the only firm in British Columbia manufacturing a complete equipment of saw and shingle mill machinery. Their plant, which was only established in 1899, is a very extensive one and consists of a large machine shop, foundry and pattern shop.

They make a leading specialty of Johnson's improved upright shingle machine, which was designed expressly for the purpose of handling Pacific Coast timber. It is built with an iron frame and carriage, long bearing and heavy steel shafting, making it a strong, durable and reliable machine, avoiding the constant repairing and adjusting as required on wood frame machines. A new motion for the movement of the carriage is seen in this machine, the carriage going with a slow steady motion towards the saw as the block is being cut, letting the saw work to its best advantage. On the reverse movement the carriage is driven back at a fast speed for two-third length of the stroke, and on the last end of the stroke the motion is checked and eased as the set is taking place, thereby avoiding any jerk or jar to the carriage, and allowing the set to make its stroke with ease, which always comes to its proper position, insuring a uniform thickness of shingle. The arbors are made of steel, 2 7-16 in diameter, perfectly true and balanced. The collars are made in an improved design and shape, which allows a wide shingle being cut and clears itself for the next without splitting or blocking. The capaacity of the machine is 30,000 to 40,000 shingles per ten hours. They are being supplied to nearly every shingle mill in the province.

The company are supplying the entire equipment of the new plant for the Lemon, Gonasson Company, of Victoria, B.C., and have so many orders on hand both for shingle mills and saw mills that they have had to increase and almost double their plant since organization in 1899. Their works and office are located at New Westminster.

THE DISTINGUISHING MARK

To install in your mill a set of saws that will suit you in every particular, it is necessary that you be familiar with some means of distinguishing the HIGH-CLASS SAWS from the others. Knowing some such mark you will always discriminate in favor of the saw which bears that mark of QUALITY.

THE ATKINS "TRIPLE A" etched on all HIGH GRADE SILVER STEEL CIRCULAR and BAND SAWS, is the sign which assures QUALITY, EXCELLENCY and absolute SUPERIORITY in Saws. "IF IT'S SILVER STEEL, IT'S AN ATKINS." Look for our trade mark.

A little reminder of the "TRIPLE A" in the way of a pretty watch charm to Mill men who write for it. Also our Mill Supply Catalogue. Both free.

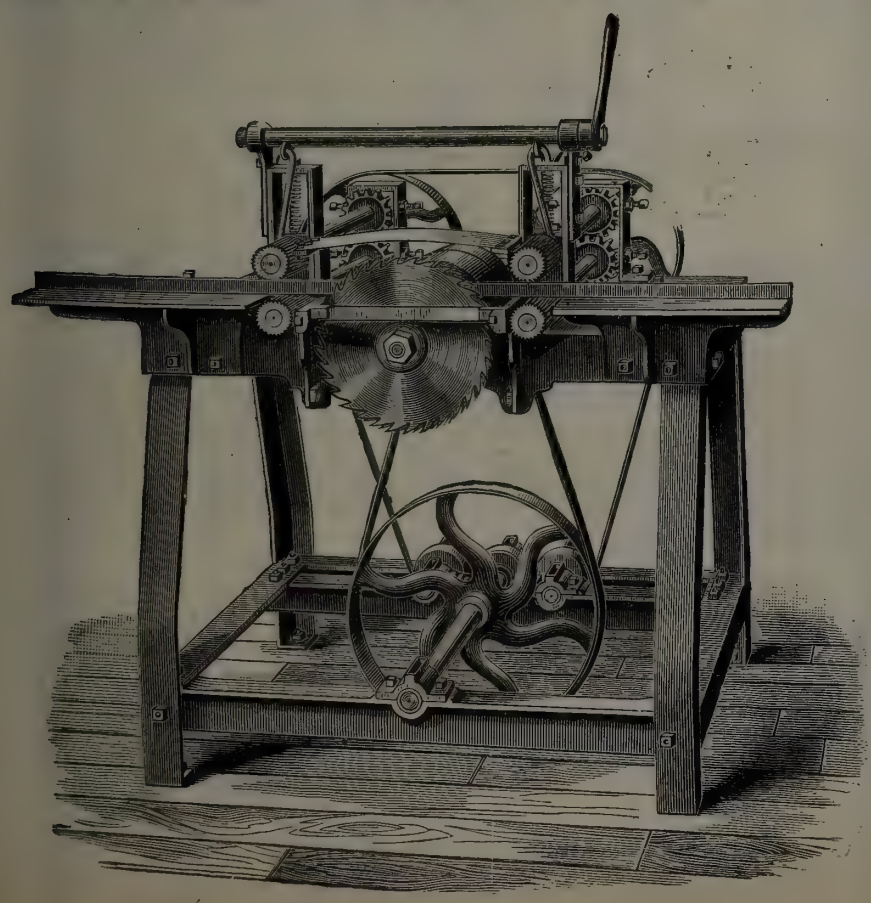
Galt, Ont.

GANG LATH AND PICKET MACHINE



There is no better machine made for the price asked. It has a solid iron frame, which with the saw arbor bearings is cast in one piece. The drive pulley is 8 in. dia. and 9 in. face. Turned inside and out, and very finely balanced. The feed and press rolls are milled out of solid steel and tempered hard. It carries four 12 in. saws, and is adapted for both Lath and Pickets. With the Lath Bolter, its companion, it is capable of turning out a larger amount of work every day, probably more than any other medium price machine in the market.

I have one of these machines in stock now, very little used, and guaranteed in perfect order. Will sell cheap.

Reliable Veterinary Remedies

No logging outfit is complete without a supply of reliable veterinary remedies. Getting the wrong kind means the loss of the use of your horses when time is valuable.

Johnson's Veterinary Remedies are guaranteed never to fail when used as directed. You get your money back if they ever do.

They are

Johnson's Horse Linimint No. 1.
A penetrating Alcoholic Linimint, Put up in one gallon jugs, with full directions, per imperial gal. **$4.50**

Johnson's Horse Linimint No. 2.
A combination of the best oils used as linimints, imp. gallon . . **$3.00**

Johnson's Horse Colic Remedy.
A sure and speedy cure for colic Imperial gallon **$5.00**

Johnson's Veterinary Healing Ointment.
Positively the best all-round healing ointment made. In use by the largest owners of horse flesh in Canada. Put up in 2 lb tins, each . . **$2.00** or in ¼ lb tins, per dozen . . **$3.00**

Johnson's Condition Powders. (Concentrated).
Put up in bulk, per lb . . . . **3c.**

These goods being put up in bulk are more economical than others, as cost of bottling, etc., is saved.

CAMP REMEDIES.

In addition to our Veterinary Remedies we make a line of medicines for lumbermen, including a strong, penetrating linimint, healing ointment, cholera cure, liver pills, cough syrup, in fact anything in the form of Camp Drug Supplies. We know that there are no better remedies made than those we offer. There may be others nearly as good, but they lack our guarantee. Satisfaction or money back. A trade discount of 10% allowed off all orders amounting to $100.

Send postal for printed matter.

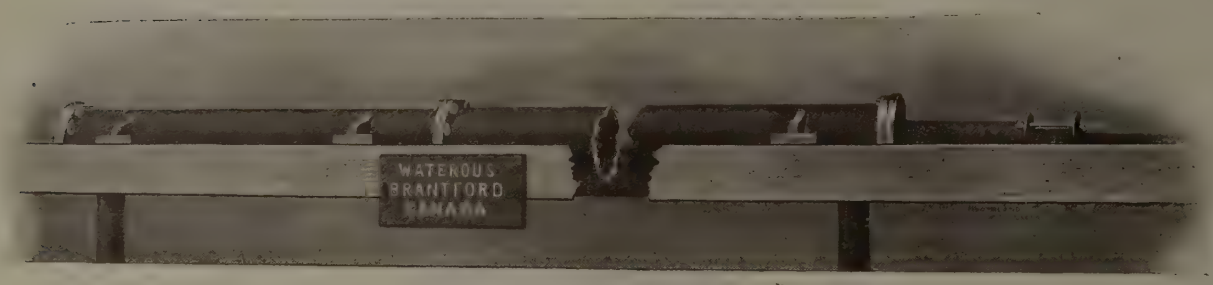
DON'T WASTE TIME

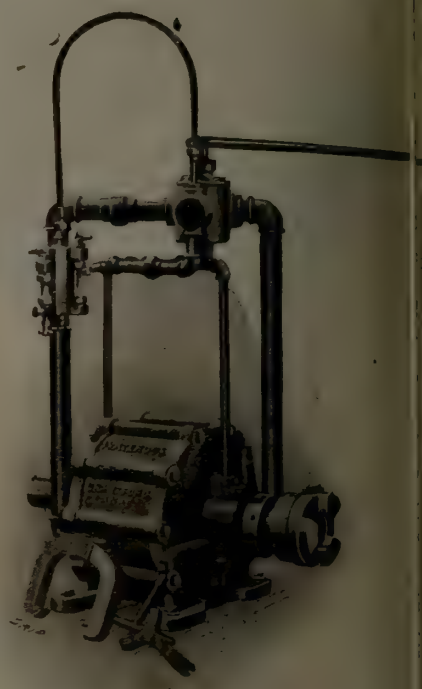
This is most essential in the operation of your mill and a reliable FEED will help towards this end fully more than any other mechanism about it. . .



DIRECT ACTING STEAM FEED

Standard sizes 7", 7½", 8", 9", 10", 11" and 12".
Cylinders in six foot lengths.

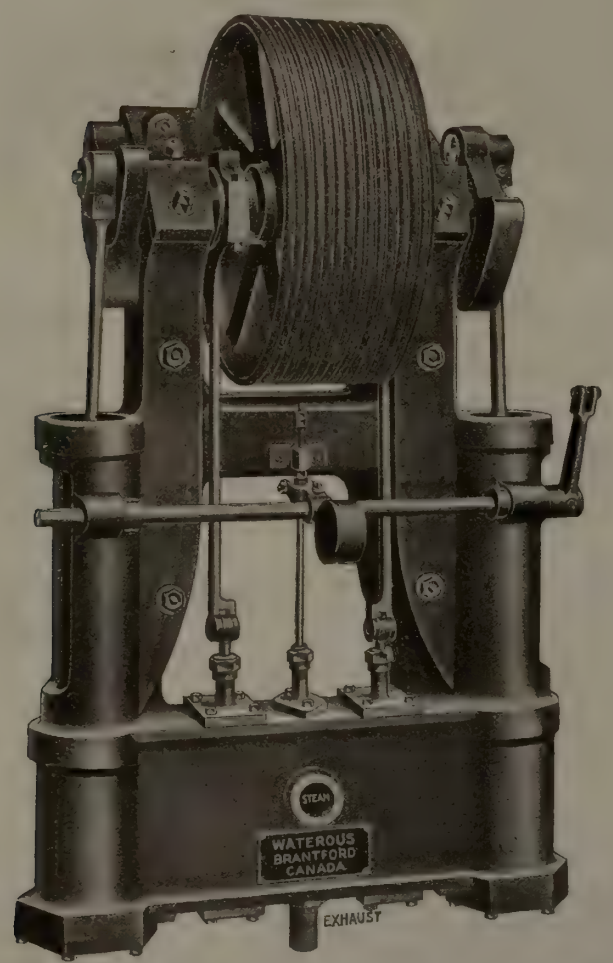
These FEEDS are provided with our latest PATENT VALVES—the best in valve construction, works easily and certainly.



THE SOULE ROTARY STEAM FEED

A splendid Feed for small mills—small and compact, therefore takes up little room and readily installed, a sure means of increasing the capacity of your mill, and made in the following sizes:

No. 1 Feed has 1½" pipe, suitable for 10,000 capacity.
No. 2 Feed has 1½" pipe, suitable for 20,000 capacity.
No. 3 Feed has 2" pipe, suitable for 30,000 capacity.
No. 3 Feed has 2½" pipe, suitable for 40,000 capacity.



THE BECK PATENT DUPLEX ENGINE FEED

is not surpassed by any other similar Feed that is made, easy to handle, easy on steam, no leaky joints, no trunions to wear. We furnish these FEEDS complete with two sheaves, all fittings and castings for attaching ropes to carriages. The Beck Feed stands for Capacity, Reliability and Economy.

THE CUNNINGHAM OSCILLATING TWIN ENGINE FEED

is so well known that it needs no special mention.

Write Us, for Prices on These Feeds

FORMERLY McEACHREN HEATING & VENTILATING CO.

A Man Who Sold Razors

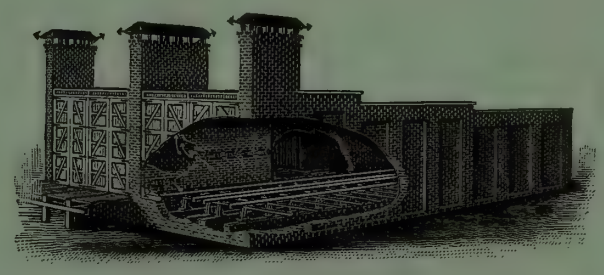
That looked all right, but worked all wrong, was asked what they were made for, since they weren't of any earthly use for mowing beards. He replied that the razors were made—TO SELL.

We are diametrically opposed to anything resembling this "made-to-sell" principle. Permanency is the result aimed at in building

THE STANDARD DRY KILN

And users will tell you that it is attained. The Standard Moist Air System is the common-sense application of a scientific principle. It dries all kinds of lumber dry—from center to surface—quickly, thoroughly and without injury to the stock.

Write for a copy of our Catalogue "D."
It tells how to secure satisfactory results.



THE STANDARD DRY KILN CO.
Indianapolis, Ind.

THE TRIUMPH TURBINE

Is the most powerful wheel on the market to-day. A glance at this cut of the centre shows that the buckets are designed to secure the **maximum** of **speed** with **great power** and a **free discharge.** Mr. E. S. Edmondson, of Oshawa, writes as follows under date of November 16th, 1903, regarding a 26 inch Vertical Triumph Wheel:

> "The Wheel is strictly first-class in every particular, and after a careful and thorough test I am prepared to say that I believe it is the best wheel in the market for Electrical purposes. It has high speed, large power, high efficiency at part gate, and has practically no leakage. I am more than pleased with the thorough and workmanlike setting you gave me throughout."

For horizontal settings in large Pulp Mills, Cement Mills or Electric Power Developments this Wheel has no equal. We invite your enquiries. Large catalogue to be had for the asking.

We are always glad to submit estimates and prices on **Improved Vulcan and Leffel Turbines, Improved Lane Circular Saw Mills, Edgers, Trimmers, Slashers, Shingle Machines, Lath Machines** and all machinery of this kind.

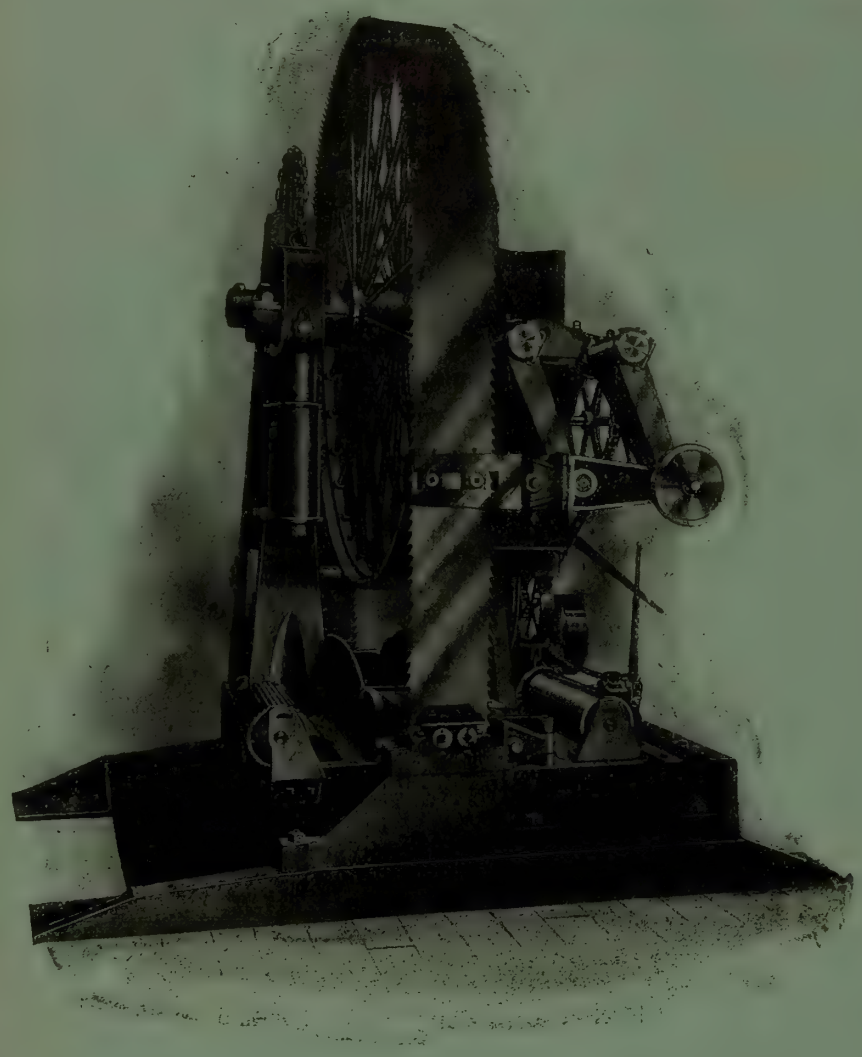
SAW MILL MACHINERY



This cut illustrates our Double Cutting

Weight Tension Band Mill

It shows the same good quality of workmanship that has made our machinery the standard for saw mills.

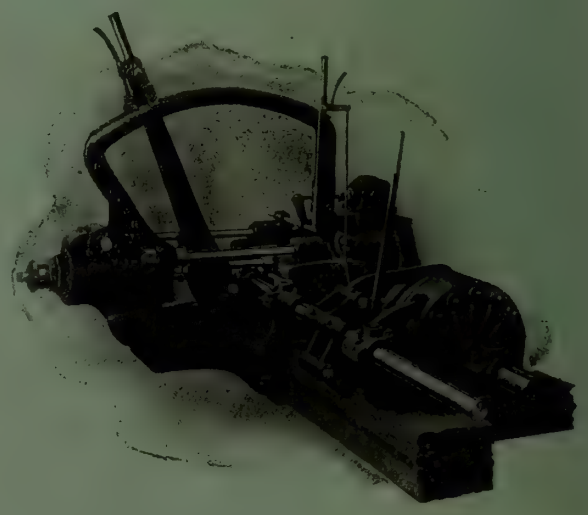
The top wheel is supported from above and guided below, which does away with all vibration of the wheel. Besides, sawdust cannot in any way interfere with the action of the adjusting and tension devices.

Saws can be changed on this mill quicker than on any other weight tension mill.

Send for our catalogue giving full information.

Along with this Band Mill, every saw-mill should have our

Improved Steam Setting Machine



It sets up to 4 inches, besides saw kerf, with one throw of the lever.

By its use, your daily cut can be increased easily 3000 feet, and the quality of the lumber greatly improved.

May we not send you a copy of our new catalogue illustrating this machine?

If you require anything for a saw-mill, write us—You should use our machinery.

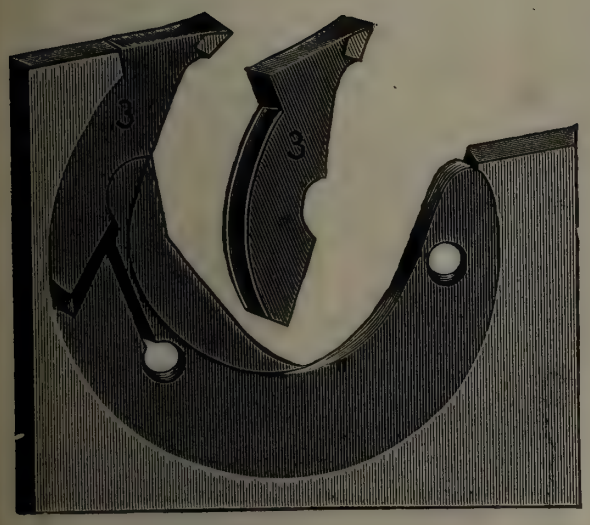
Head Office and Works : - **PETERBOROUGH, ONT.**

R. H. SMITH CO., LIMITED

St. Catharines, Ont.

We are the Sole Manufacturers of Saws under the **Simond's Process** in the Dominion of Canada.

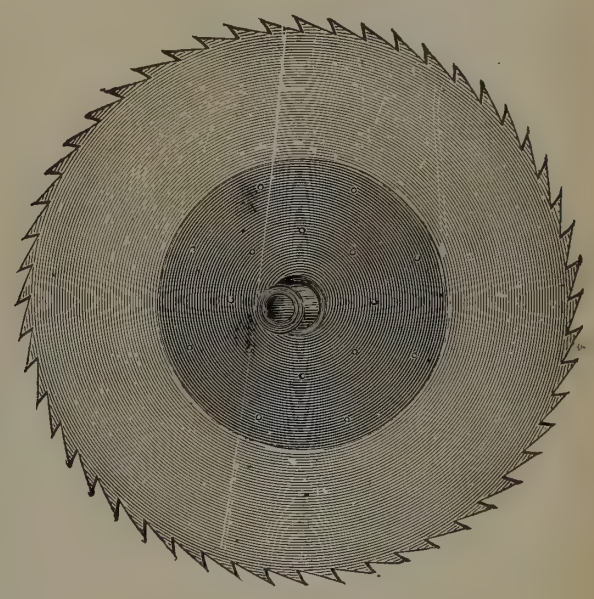
There is no process its equal for tempering circular saws. Other makers recognize this fact, as some of them, in order to sell their goods, claim to have the same process. **All such Claims are FALSE,** as the patentee in the U. S. and ourselves are the only firms in the world who use it.



INSERTED TOOTH SAWS

Notice the improved shank. We call particular attention to the swell which strengthens it at the weakest part and which gives it more wear than the old style.

Shanks made in usual gauges and to fit your saws perfectly.

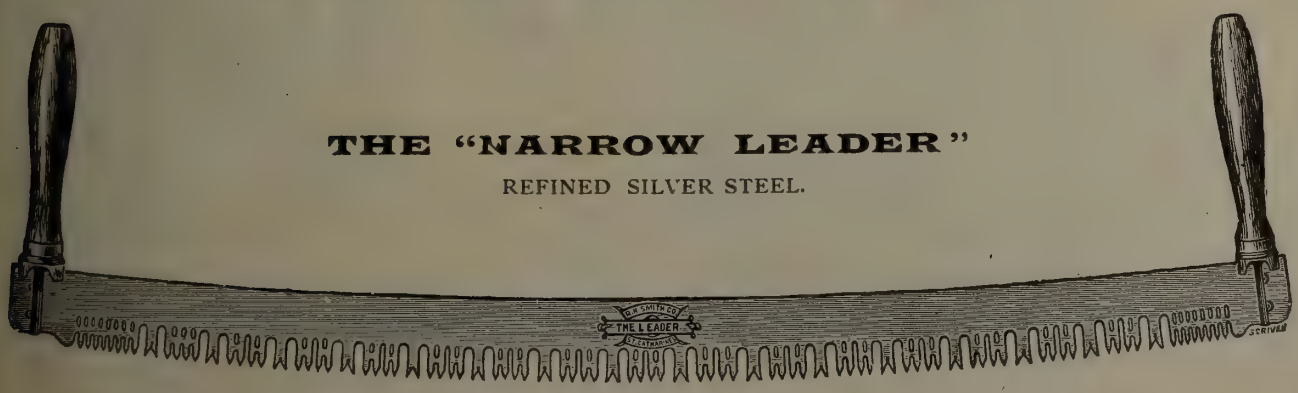


SHINGLE SAWS

The quality of the "Simonds" Shingle Saws is proven by the fact that the largest shingle and machine manufacturers in Canada are using them.

Run a "Simonds" and you will increase your output.

CROSS-CUT SAWS



The Simond's temper and style of tooth make the "Leader" the fastest and easiest cutting saw manufactured.

Write for prices.

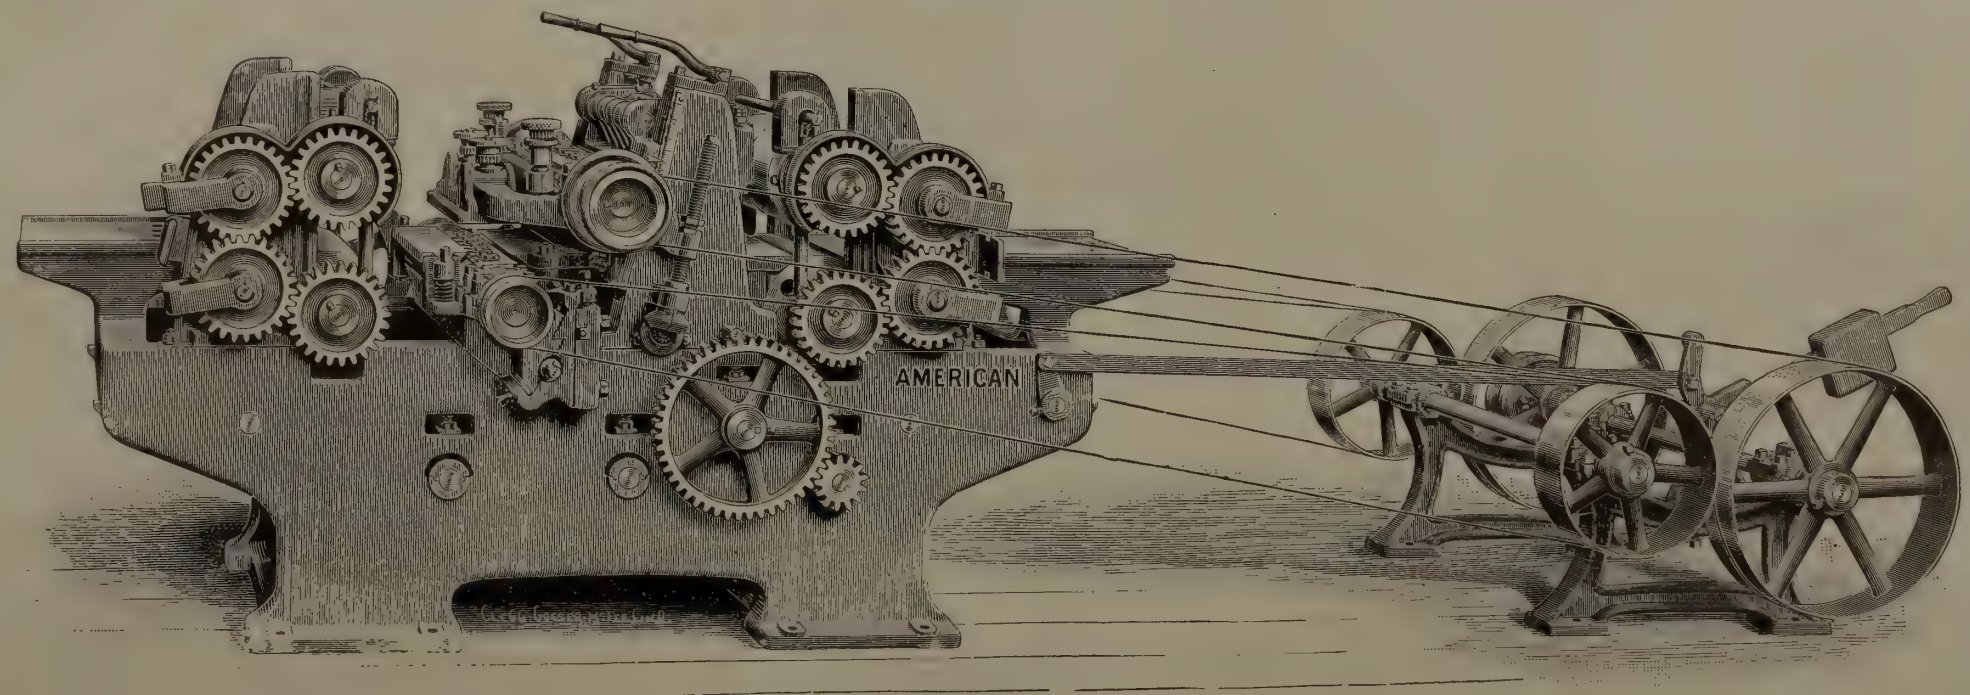
R. H. SMITH CO., Limited, St. Catharines, Ont.

...HOYT PATTERN...

AMERICAN NOS. 45 and 46 DOUBLE SURFACERS

Work 26 inches and 30 inches wide by 8 inches thick.

..SUBSTANTIAL.. ..POWERFUL.. ..RAPID..



Four strongly geared feed rolls. The upper in-feeding rolls are divided into six sections, permitting six pieces of lumber varying in thickness to be surfaced at the same time, and by our parallel lifting device and heavy pressure each section rests firmly on each piece. Stock as short as 12 inches in length can be readily surfaced.

Top and bottom cylinders are interchangeable, four-sided, carrying two knives. The Journals are large in diameter, running in long self-oiling boxes.

The Top Chip Breakers and pony roll are divided into six sections, acting independently and lay very close to the cut.

All driving gears and pinions are mounted on shafts which run in self-oiling boxes. They are heavy and strong, allowing a wide range of feed.

For full detail information, prices and catalogue, address nearest salesroom.

VOLUME XXIV. NUMBER 8. } TORONTO AND MONTREAL, CANADA, AUGUST, 1904 { TERMS, $1.00 PER YEAR Single Copies, 10 Cents

PROMINENT BRITISH COLUMBIA LUMBERMEN.

MR. J. A. SAYWARD.

Mr. J. A. Sayward, who conducts the large saw-milling business in Victoria, B. C., established by his father in 1858, comes of stock who had to do with lumber. His grandfather was a shipmaster in Maine, where ships were built in great numbers, and his own father learned the trade of carpenter. He went to California in 1849, and after spending two years at Sacramento, began a lumber business in San Francisco. This he continued until 1858, when the discovery of gold in Cariboo brought British Columbia into prominence. He came north and began the business which is still being maintained in an enlarged and improved form.

Mr. Sayward's (sr.) first mill was at Mill Bay, in the Shawinigan district on Vancouver island, which was the whole of the province at that time and where the settlement was located. The mill was operated by water power, and twenty-six years ago it was removed to its present site in Victoria city. A steam plant was at that time installed, and since then this has been the motive power. It has been enlarged and improved until it has a capacity of 50,000 feet in ten-hours. A sash and door factory and planing mill, and also a shingle mill, are included in the establishment.

Mr. J. A. Sayward, who succeeded his father as head of the firm, is still a young man, not yet 40 years of age. He has been engaged in the lumbering business all his life, and has devoted his energies entirely to it. He is assisted in the handling of the office work by Mr. Walter Chambers, and an efficient staff is also employed. Speaking of the outlook this year, Mr. Sayward says: "Trade is fair this year so far. The Northwest business is not quite up to what might be expected, but we have the prospect of doing a good line of trade there. In Victoria city the building is brisk this year and ont local trade is consequently good."

Shipments by sailing vessels and steamers form part of the trade done by Mr Sayward, who has considerable of the local trade, his mill being the only large one in the city. Shipping by rail to Manitoba and the Northwest has been engaged in for the past year or two, the transfer facilities by railway barges to the mainland offering every advantage enjoyed by mills on the direct line of railroad. Mr. C. J. Archibald represents the firm in the Northwest.

The business employs some 150 men in all, and the firm operates its own camps. The tug Hope is owned by the mill and tows the log booms to the mill. The limits owned by J. A. Sayward were secured in the early days by his father, and comprise some of the most valuable timber lands on the Gulf of Georgia islands, Vancouver island and the Mainland.

MR. J. A. SAYWARD, Victoria, B. C.

DOUBLE-CUT BAND SAWS.

The necessity of competent filers has become more apparent than ever to mill owners since the introduction of the double-cut band saw, writes A. J. Burton, of Vancouver, in The Wood-Worker. How often we hear of filers who were very successful in handling single-cut saws, falling down or making a complete failure in the attempt to file one of the large double-cut mills, especially those that cut the hard yellow pitch pine and the woolly cottonwood of the Southern States and the Douglas fir of the Pacific coast.

The reason for this failure is quite clear to the progressive filer. His experience teaches that where there is an effect there must be a cause; he is always ready to learn the opinion of his brother filers and others with whom he comes in touch. These opinions and ideas, added to his own observations, and adopted and put in practical use, soon win for him success and the title of expert or master of his profession.

I will try and lay down a few points from my daily experience while a filer, which never failed to give the highest results, both as to quality and quantity of lumber, and the saving of the lives of the saws and file room machinery under my care:

My first advice is, do not try to see how long your saws will run without swaging or putting them on the bench to see if there is need of a little tension here or there, or if there be a lump that should be leveled. Do not let your grinder go day after day without looking to see if there is any loose motion in the head slides or boxes. Make a daily practice of looking over and examining your machines; see that they are all clean; take up all loose motion. Look over your band saws on the bench every second run; it will only take twenty minutes or so each time, and "a stitch in time saves nine." Don't forget that your study of little points will increase your company's weekly output; you will soon become known to your employer, and the chances of an increase in your salary will be greatly enhanced.

The most important points to be observed and practiced are, keep your saws perfectly flat, both lengthwise and crosswise, with perfectly straight edges; the latter can be best obtained by the use of a fine copper wire, say 12 feet long, held parallel with the bottoms of the gullets of the teeth for double-cut saws, as the gullets are always of an even depth if the grinding is properly done, whereas the points of the teeth vary in length according to the amount of wear from sand or other causes after each run. Using the straight-edge against the teeth will not give such good results.

A perfectly flat saw, with a light, even tension, is more desirable than a saw so full of tension that it will be almost impossible to level it. The best results will be obtained from a double-cut saw if the blade is evenly tensioned throughout as much as will allow it to lie perfectly flat, with its own weight, upon a 6-foot leveling table. The tension should be put in with a gauge, of a perfect circle, and with sufficient amount to give the above results.

Next, use a full swage and use the shaper only. Do not gauge the teeth every time you swage, as this is not necessary to fact cutting or to smooth timber, but see that the teeth are at all times straight, and with an even, light swage. I do not mean a light corner, but a good, heavy corner, with no more spread than needed to clear the saw. The lumber will then be smoother, the saw will stand up better, there will be less wear, and the filer will have less work.

IMPORTS OF FOREST PRODUCTS

The following table shows the value of the products of the forest imported free of duty into Canada from the United States during the months of March, April and May, 1904. The table is compiled from the unrevised monthly statements of imports and exports issued by the Department of Trade and Commerce :

Class of Timber.	March. Value.	April. Value.	May. Value.
Sawed or split boards, planks, deals and other lumber	$207,405	$260,904	$236,800
Logs and round unmanufactured timber	29,894	11,062	17,885
Timber or lumber, hewn or sawed, square or sided	6,489	29,967	11,705
Cherry, chestnut, gumwood, hickory and white wood	45,861	42,633	55,561
Oak	122,823	137,252	125,926
Pitch pine	14,887	19,562	29,745
Mahogany	4,342	15,259	5,885
White ash	15,279	9,770	14,469
Walnut	2,855	9,259	4,161
Spanish cedar	322	313	317
African teak	1,498	316	139
Pine and spruce clapboards	1,651	747	361
Laths	3,335	7,379	4,825
Shingles	1,621	3,058	693
Staves	16,502	8,013	15,011
Shovel handles	6,520	2,209	2,698
Felloes of hickory, rough sawn to shape only	1,936	2,560	4,412
Handle, heading, stave and shingle bolts	4,136	1,526	4,291
Hickory billets	555	79	110
Hickory for spokes of wheels	390	253	244
Hickory spokes, rough turned	27,279	29,860	18,027
Hubs for wheels, posts, last blocks, etc	4,219	2,596	3,287
Fence posts and railroad ties	4,346	13,572	8,830
Total	$524,265	$604,169	$625,382

EXPORTS OF FOREST PRODUCTS

The following table shows the value of the products of the forest exported from Canada to the United States during the months of March, April and May, 1904. The table is compiled from the unrevised monthly statements of imports and exports issued by the Department of Trade and Commerce :

Class of Timber.	March. Value.	April. Value.	May. Value.
Planks and boards	$205,830	$347,191	$523,091
Basswood lumber	332	756	425
Pine deals	237	1,338	7,890
Spruce and other lumber	.....	12,696	7,819
Laths	28,391	29,857	54,830
Pickets	238	341	6,245
Scantling	3,387	1,698	16,230
Shingles	75,378	136,429	153,137
Shooks	1,605	379	6,943
Staves and headings	4,217	4,256	8,382
Telegraph and other poles	1,155	4,924	1,990
Cedar and tamarac posts	.....	1,397	2,262
Shingle bolts	500	138	350
Sleepers and railroad ties	5,816	12,493	14,327
Stave bolts	701	113	163
White pine timber	574	.....	.....
All other square timber	431	507	265
Pulp wood	117,229	142,204	163,225
Lumber not elsewhere specified	3,480	5,783	14,195
Cedar logs	90	.....	700
Elm logs	24	370	70
Hemlock logs	576	48	15,497
Spruce logs	2,702	2,958	33,221
All other logs	16,692	10,429	30,747
Total	$469,585	$716,305	$1,062,004

A MODERN CANADIAN TIMBER LIMIT.*

No name in the lumber industry is better known than that of J.R. Booth, of Ottawa, or has a longer or more direct connection with its history and development. A visit to Ottawa would not be complete without seeing the Chaudiere Falls, which furnish such a magnificent water power, and Mr. Booth's immense sawmill, probably the largest on the continent, of 700,000 feet board measure capacity per day of twenty hours. This mill is unque also in that it is kept running both summer and winter, the supply of logs being brought in by the Canada Atlantic Railway during the winter months from the limit on the Madawaska River owned by Mr. Booth and known as the Egan Estate Limit. A visit was made to this district a short time ago by two members of the Canadian Forestry Association, with the object of getting such information as a hurried visit might permit as to the condition of the forest and the method of management.

Leaving Ottawa by the Canada Atlantic Railway, and passing through the agricultural counties of Carleton and Renfrew, at a distance of about one hundred miles from the city the country begins to change its character. Settlement becomes more scattered, the ground more rough and hilly, coniferous trees appear here and there in clumps, the rampike begins to make itself a feature of the landscape. From Barry's Bay to Aylen Lake the green of the new growth breaks the hard lines, but for the ten miles from Aylen Lake to Madawaska there is nothing to relieve the bareness of the scene. On each side of the track the forest of rampikes stretches away, blackened, barren, desolate, yet bearing mute witness of the noble forest which had occupied the land before the fires destroyed its beauty and its riches. These fires are not all caused directly from the railway, and the management of the road being controlled by a lumberman, great care has been exercised both in construction and operation to prevent danger from this source. But the easy access permitted by means of the line increases the risk from other directions, and fires start in proximity to the railway frequently though as a rule they are kept sufficiently in check to prevent serious loss. One fire can, however, do damage that a century cannot repair. When a fire occurs the staff, not only of the lumber camps, but also of the railway, is called out and everything else is subordinated for the time being to the necessity for preventing the spread of the conflagration. A determined fight was required during the dry months of the spring of the past year to control the fires and to prevent the destruction of the village of Madawaska.

The Egan Estate Limit, which covers an area of 333 square miles, is situated both north and south of the railway line and on the north touches the limits of Algonquin Park. Operations have been carried on by the present proprietor for a period of forty years and, although the cutting has not been done as severely upon it as upon some other limits, still it has usually amounted to eight to ten million feet board measure per annum, but the resources of this limit will permit of the cutting of a similar quanitity for possibly thirty years more. What the possibilities are after that period has elapsed only a careful examination of the whole area would give the data to decide, but a description of the present stand and methods of lumbering may present some facts that have bearing on the question.

From west of Madawaska, which is located about the centre of the limit, a logging road runs in a distance of about ten miles to the north, where operations are now being carried on. The district which is being lumbered covers an area of about six miles, but the forest is as nearly pure as can be found anywhere in Canada, of pine of the best size and quality. The stand would in parts at least reach 20,000 feet, b.m., to the acre, the trees being one hundred feet and upwards in height, while the general diameter of the logs ranges from sixteen to thirty inches. An examination of the annual rings of several logs showed an age of 120 to 180 years. Scattered among the pine, but not forming any important part of the stand, are white birch, balsam and hemlock, none of which have attained to a large size. Along the low grounds the black spruce is found, but nowhere in a continuous stand and the average diameter does not exceed eight inches, with a height of 60 to 70 feet.

The compactness of the area on which operations are conducted permits of easy accees by rail. The trees are felled by sawing. A notch is cut with an axe on the side to which the tree is to fall and the saw is used to cut in from the opposite side. Inch by inch the saw eats its way through the great trunk, the top begins to waver, it slowly inclines, a crack is heard at the stump, the men stand clear, slowly and majestically at first the monarch of the forest bows his head, but with ever increasing speed till at last it crashes swiftly down, creating a miniature snowstorm, and bearing down the small trees in its path. The work of a century is brought suddenly to an end, but only to be

*Contributed to Rod and Gun by the officers of the Canadian Forestry Association.

changed into new forms and to complete more fully its sphere of usefulness. After the trees are felled they are cut into logs of proper length with the saw and those that are of sufficiently good size and quality may be made into timber, square or waney. They are then drawn to the rollways, to which roads are cut, and from which they are carried by sleighs to the railway. There by steam loaders they are elevated on flat cars and transported to their first destination. The logs will be sawn into boards at the mill at Ottawa. The timber will be taken to Coteau and rafted by the St. Lawrence to Quebec, where water delivery will be given to vessels supplying the old country market. The deftness and skill with which the makers of square or waney timber can smooth the side of a log with no other tool than the broadaxe, so as to equal the work of the best plane, is beyond conception to one who has not seen the operation. So expert do they become that one of them was prepared to wager that he could smooth a log as well with his eyes shut as with them open. Time did not permit, however, of putting him to the test.

The cut is practically a clean one. All the pine is ready for the axe and when a tract is cut over nothing is left but a small and scattered stand of birch, balsam and hemlock. The land is hilly, the elevations being considerable and in some cases quite abrupt. The soil is, so far as could be ascertained, light and stoney, and unfitted for successful agriculture. There are a few farms located within the bounds of this limit south of the railway, and for a few years, before the forest soil is exhausted, the returns seem to indicate that agriculture might be successfully carried on, but continued cropping soon demonstrates that permanently profitable occupation of these lands for farming purposes is impossible.

At the lumber camps visited the only wood taken out in addition to the pine is the yellow birch. This is found mainly on the hardwood ridges cresting the hills, where the coniferous forests change to one of almost pure hardwoods, comprising yellow birch, maple, elm and ironwood. Ot these the yellow birch forms the finest and largest trunks, some logs reaching thirty inches in diameter, while the average is sixteen to eighteen inches. These trees are cut into deals for the British market, where, it is stated, though no doubt the allegation is slander, they undergo a transformation and appear in furniture as cherry or even mahogany.

To return to the question as to the future possibilities of this limit, it may beset down as distinctly settled that no such stand of pine as is now found will be reproduced. A cycle of 120 to 180 years is greater than can be again allowed. The timber must be grown at a faster rate and in a shorter period. But shortened as it may be it can hardly be much less than one hundred years to give lumber of proper value and get the best returns. This is why devastation by fire is so harmful and why the problem is one that requires early consideration. That the pine is reproducing itselt naturally is certain. To what extent or how far the process has advanced there was no opportunity to ascertain, but careful and thorough studies of selected areas such as this limit presents should be made, as in no other way can the necessary data on which to base methods of permanent management be obtained. This is a matter that should be taken up by the government and the lumbermen in co-operation so that both scientific and practical knowledge may be brought to bear upon the question. As the pine is a mature and even stand, the method of clean cutting is the best and only one, but a study of the process of reproduction might suggest some modifiations that would help to this end. Accurate, definite, scientific knowledge of the physical, natural and economic conditions is what is required and this can only be gained by full and close investigation of concrete cases, and of the forest as it now exists and is being exploited.

This sketch of lumbering operations would not be at all complete unless some description was given of the shanties themselves. The picturesque log shanty is here becoming a thing of the past. Logs are too valuable to be used whole for this purpose any longer and the shanty buildings are made of boards shipped up from the mill at Ottawa. The buildings in which the men sleep are well built and comfortable, are commodious and well ventilated and the double row of bunks down either side make very good quarters. The cook's domain is in a separate building, which also forms the dining room for the men. The fare supplied is of good quality and of sufficient quantity and variety to satisfy any reasonable, or perhaps even unreasonable person. The complaint of a wife of a shantyman who lived in Ottawa, that she could never supply things to please her husband after he came down from the shanty, may therefore have had some other animating cause than the contrariness of the male animal in general when he thinks that he has the opportunity of making a show of an authority which he does not really possess.

The typical shantyman is good-natured and friendly in disposition, ready to give help or information, open in character and with a weakness for getting his photograph taken, which is at times somewhat embarrassing. They are a strong, sturdy class of men, for whom it is to be hoped Canada will always have room and for whom in her perpetuated forests the health giving and strength-developing labor which the lumber business supplies may always be furnished.

A Lumberman's Shanty on Mr. J. R. Booth's Limit, Madawaska.

FOREST FIRES.

Forest fires have visited several of the provinces during the past month. Thousands of acres in the vicinity of Sydney, Nova Scotia, have been devastated, the loss reaching about $200,000. In British Columbia much timber in the vicinity of Wulffshon Bay and Gordon Pasha Lake has been burned, and back of Ladysmith the destruction has been considerable. Early in July bush fires were raging in the Baie des Chaleurs district of Quebec, and all the buildings surrounding King Bros.' mills at Pabos were destroyed, including the residence of Mr. McNaughton, the manager. Only herculean efforts on the part of the employees saved the extensive mills. It is estimated that the loss to timber lands and buildings in Quebec is $200,000.

In accordance with the established policy of the Ontario Crown Lands Department regarding the safeguarding of the province from fire, a regulation has been adopted which will be inserted in the agreements of all railway companies building railways through the newer districts of Ontario. The regulations consist of two clauses, one of which is :

"It is hereby agreed that wherever the line of construction of said railway runs through lands of the Crown which are not covered by timber license, and the government deem it proper for the protection of the forest wealth adjacent to the line of construction to place on duty a staff of fire rangers for the protection of timber, it shall be at liberty to do so, and all expenses incurred thereby, whether for or in respect of men's wages, or any other services, shall be borne and paid by said railway company."

The other clause is similarly worded, and provides for protection of timber under license. By this means the control of fire protection is kept in the hands of the department, which with its experienced ranging staff, will be able to look closely after the work and see that adequate protection is afforded.

BRITISH COLUMBIA SAW MILLS

Photographed and Described by Our Travelling Representative.

THE ELK LUMBER & MANUFACTURING COMPANY.

The operations of the above company in British Columbia date from July, 1903, when the company was organized with a capital stock of $250,000. The saw mill of the company is shown in the accompanying illustration. It is located on the Elk river one-half mile to the west of Fernie on a section of the company's property of 200 acres of crown-grant land. It is 30x130 feet long and is equipped with circular, trimmers and the usual saw mill machinery. The planing mill attached is equipped with two planers manufactured by Cowan & Company. The capacity is 25,000 feet per day.

The principal timber manufactured by this firm is cedar, which constitutes fifty per cent. of the total manufactured. Besides the cedar a good deal of spruce, fir and tamarac is also manufactured. The logs are cut on the company's own limits of 16,000 acres of land in the Elk river valley.

Seventy-five per cent. of the output goes to the Territories and Manitoba, the other twenty-five being distributed locally in and around the mines.

As the property was only purchased July, 1903, from Mott, Sons & Company, the company purposely delayed any extensions or improvements until the result of the first year's working was shown. The result was very encouraging, and in view of the fact that the North-West market is going ahead by leaps and bounds, the company have decided to build a double cutting band plant, with a capacity of 125,000 feet per day.

The officers of the company are: O. A. Roberson, president; D. V. Mott, manager; J. C. Wood, F. Barrows and W. P. Dunton.

THOS. KIRKPATRICK.

One of the finest shingle manufacturing plants along the Pacific Coast is that owned by Thomas Kirkpatrick and situated on the south side of Burrard Inlet, in the small township of Hastings, four miles east of Vancouver. The plant is situated in a large yard occupying 500 feet of the water front and running back to the main line of the C. P. R. It consists of two mills, a small one and a large one. The small mill is 51 feet long by 28 feet broad and is fitted up with three Dunbar shingle machines from Woodstock, N.B. Connected with it is a boiler room 28 x 21½ feet equipped with one engine, one boiler and a dynamo for the supplying of electric light, enabling the owner to run day and night during the busy season. There is also a bolt room 25 x 23, a dry kiln 70x18 feet, and four sheds.

The large mill, which was only constructed eighteen months ago, is 32 feet long by 75 feet broad and is equipped with five shingle machines, four of which were manufactured by the local firm of Letson & Burpee. Adjoining it is the boiler room 48 x 18 feet, equipped with one Wm. Hamilton boiler, and the engine room 26 x 22 feet, fitted up with one Dunbar engine. There is also a bolt room 25 x 25 feet, one dry kiln 100 x 24 feet, and two sheds of 30 x 24 feet and 70 x 30 feet respectively.

The daily capacity of the small mill is 20,000 shingles and the large one 30,000, making a total output of 50,000 shingles a day of ten hours.

Mr. Kirkpatrick also owns a large mill formerly owned by R. Welsh at Westminster, the main building of which is 80 x 28 feet and possessing a huge dry kiln 87 by 27 feet. It is equipped with five shingle machines, three from Shaackes, of New Westminster, and two from Letson & Burpee, of Vancouver. The capacity is 125,000 per day, which in conjunction with the other plant makes a total daily output of 175,000 shingles.

This vast output, which usually figures out at about 50,000,000 a year, is marketed mostly in Ontario, New England States and our North-west Territories at the rate of one car per day. To meet the vast demand made upon his mills Mr. Kirkpatrick lately purchased 3500 acres of first class red cedar on Jarvis Inlet and Howe Sound, B. C.

Like many more successful western men Mr. Kirkpatrick hails from Nova Scotia, coming to Vancouver in the year 1886. In 1890 he purchased a site at Cedar Cove and erected a shingle mill, which he operated until it is was burnt out in March, 1902. From the beginning his business steadily increased until in 1900 he purchased the mill owned by the late A. McNair situated at Hastings, this being part of his present property.

THE LADYSMITH LUMBER COMPANY.

The operations of this company, which started about two years ago, have been accompanied by a series of energetic developments culminating in making its mills among the largest and most prosperous to be found along the coast of British Columbia. Last year, notwithstanding the burning of their lumber mill on June 1st, the company shipped east by December 31st 6,100,000 feet of lumber, 5,000,000 lath and 5,986,000 shingles. In connection with the latter shipment, it should be stated that they only commenced the manufacture of shingles on June 1st, their new shingle mill being opened—fortunately for the company—on the same day they had the misfortune to lose their lumber mill.

Their lumber mill has been re-opened, its capacity having been doubled in rebuilding, but the company, not content with this increase, purpose—provided the Government can be induced to grant some adequate protection against our American competitors—to erect in the course of the next year another mill with a capacity of from 70,000 to 100,000 feet per day.

The lumber mill is situated four miles south

SAW MILL OF THE ELK LUMBER & MANUFACTURING COMPANY, FERNIE, B. C.

of Ladysmith, on the E. & N. Railway, and is equipped with thoroughly up-to-date machinery and requisite appliances of a first-class plant, including planers from McGregor-Gourlay Company, of Galt, and engines built by the Albion Iron Works, Victoria. Among its specialties is a battery for manufacturing flooring made and invented in Wellington, capable of 30,000 flooring a day.

A shingle mill is situated in Ladysmith adjoining the Tyee smelter, on the water front of Oyster Bay, with the tracks of the E. & N. Railway in its rear. It is considered one of the best on the Coast and was designed and built by Mr. W. H. Welbon, of Vancouver.

On the Limits of the Ladysmith Lumber Company, Ladysmith, B. C.

All the timber supply is obtained on the company's own limits, Crown granted lands, and consists chiefly of fir, spruce and maple.

The nestor of the company can be justly considered Mr. J. W. Cockburn, the managing director. He is an Ontario product, and is possessed of all the energy, vim and snap usually associated with the inhabitants of that province, he being ably assisted in his work by Mr. William Munsey, president, and Mr. W. Telford.

On the Limits of the Ladysmith Lumber Comapny, Ladysmith, B. C.

At the present time the company employ 100 hands, but with present prospects fulfilled, there is every reason to believe that this number will have to be materially augmented in the near future.

THE KING LUMBER MILLS.

The lumber industry of British Columbia has grown very rapidly during the past few years, this being especially evident in the East Kootenay district along the line of the Crows Nest Pass Railroad all the way from Kootenay Landing to Fernie. Of the many new companies starting operations in that section the King Lumber Mills, Limited, have shown themselves among the most enterprising. The company was organized in the year 1902 as the King Mercantile Company of Cranbrook, continuing under that title until June of this year, when a charter was obtained changing the title to the present one.

The company owns two mills and a planing mill situated three miles west of Cranbrook on the Crows Nest Road. The planing mill lies right on the track, while the mills are one half mile and one and one half miles due north from the railroad respectively. All the manufactured lumber is transferred to the planing mill by a log tramway.

The upper mill, which is one and a half miles from the track, is 35 x 100 feet and is situated along the shores of a lake which provides a natural reservoir for the logs. It is equipped with a circular saw and the usual sawmill machinery and has a capacity of 40,000 feet per day of ten hours. Driving power is obtained from one engine of 100 horse power and one Leonard boiler.

The lower mill is a portable one with a daily capacity of 25,000 feet.

The planing mill occupies a site of twelve acres right along side the track, all the lumber manufactured by the company being piled here for shipment. It is a two story building 25 by 100 feet and is equipped with four dimension planers, surfacer, matcher, sticker, band saw, rip saws, etc.

The principal timber cut by this firm is tamarac, which constitutes 60 per cent. of the output, fir following with thirty per cent. and white pine with ten per cent. All the logs cut are obtained from the company's own limits, which consist of 21,000 acres around Cranbrook and Yahk.

The board of directors consists of Senator A. A. King and family and his brother, Dr. King. Mr. M. B. King, the manager, was raised in Chipman, N.B., where he engaged in the lumber industry with his father, who has large mills there. He came to British Columbia in the year 1900, entering the mercantile business in Cranbrook. However, as his tastes all lay with the lumber industry, he left this in 1902 to commence operations with the company's present properties. He is about to commence the building of a large mill at Yahk with a capacity of 40,000 feet per day.

The King Lumber Mills, Limited, Cranbrook, B.C. Dray Load of Logs Scaling 3,200 Feet.

THE CLOVERDALE MILLING COMPANY.

The above firm commenced operations in August, 1900, running the mill for one year and then selling out to the leading stockholder, Mr. W. E. Laking, the present owner, an experienced lumberman hailing from Ontario. The mill is situated on the Great Northern Railway at Cloverdale in the Westminster district, and possesses splended facilities for transportation by rail. It is given over entirely to the manufacture of cedar shingles, which are so excellent in quality as to command a sale for almost the entire output in Ontario. Quite a goodly number too are sold in Iowa, Nebraska, Wyoming, Utah and other middle west states.

The main building is 80 feet long and 40 feet broad and is equipped with two shingle machines and all the other machinery found in a thoroughly modern shingle mill. The boiler house which adjoins the mill is built of iron and brick, being thoroughly fireproof. It is equipped with one 60 h. p. boiler and one engine. A dry kiln 20 feet by 50 feet takes care of the output, which is 50,000 a day. No mill in the entire province or on the continent can be said to possess more protection than this mill in the shape of fire apparatus, although it is fully twelve miles from any body of water. So thorough is the protection afforded that inside the space of a few moments the entire property can be flooded with water.

Cloverdale Milling Company's Saw Mill at Cloverdale, B. C.

PETITION OF THE LOGGERS OF BRITISH COLUMBIA.

The loggers of British Columbia who have petitioned the Government for the repeal of the act prohibiting the exportation of logs have prepared the following statement of the conditions governing the logging industry:

A petition addressed to the Government of British Columbia is now being circulated praying that the embargo on logs be removed and that free access to the markets of the United States be allowed the loggers of British Columbia. In support of that petition it is proposed here to set forth as briefly and concisely as possible the present condition of the logging industry and its relation to the general welfare of the whole people.

It is a fact, and freely admitted, that the logging industry is to-day in very bad shape. The market is limited and the price of the rougher grade of logs is below the cost of production ; further, owing to the lessened demand for rough lumber and common building material it is now almost impossible to sell rough or merchantable logs on the Coast of British Columbia at a profit. Particularly does this apply to cedar, as there are to-day millions of feet of cedar logs lying in the water at and near Vancouver for which no demand can be found. A large percentage of these cedar logs belong to the mills and are not being cut up simply because there is no market for lumber of this grade.

Such being the facts, it can easily be understood how almost impossible it is to sell to them a grade of logs that they are already overstocked with.

The question naturally arises : Why were logs in such demand eighteen months ago and what has caused this heavy slump ? There are a number of causes, one perhaps being the excessive output of logs last year when prices ranged much higher and demand was good, but the principal and most important one is the large increase in the number of mills throughout the Kootenays. There is now invested in the lumber business there no less than $5,000,000 and the number and capacity of these mills is still growing. Many of the larger mills, equalling in equipment and capacity the mills of the Coast, have operated for the first time this summer.

Logs can be delivered at these mills at from $1.00 to $1.50 per M. cheaper than on the Coast, wages are as low if not lower, and they have a less freight rate of about $4.80 per thousand on rough lumber shipped to the North-West Territories. This practically gives the market for rough and common lumber into the hands of our countrymen in Kootenay and is largely responsible for the lack of demand for rough and merchantable logs here. It must be remembered in this connection that their timber is mostly small and rough and that for this reason the Coast still has the bulk of the trade for finished material, such as flooring, stepping, siding, mouldings, etc.

Such being the case, the Coast logger must find another and larger market for his product or cease to operate.

It is useless to theorize or talk cheap sentiment, the facts are as given above, we must have a further market or suspend operations.

What effect has the present situation on the people of British Columbia ?

First, let us look at it from the loggers' standpoint : He is losing money, he is seeing the hard earned accumulations of years of toil slip through his hands despite his best efforts, with a certainty, if no relief is forthcoming, of going insolvent ; "going broke" it is called, and going broke he is. The merchant, wholesale or retail, in whatever line he may be, is to-day feeling very keenly the depression in the logging business, camp accounts are not being met, money is scarce, and the whole city feels the stagnation in this most important industry. Workingmen are idle in Vancouver by hundreds, with every possibility of their number increasing, wages are necessarily lower, and employment hard to get.

Some of the mills are holding millions of feet of rough logs that they will not cut and if permitted would gladly turn them into cash by towing them across to the American side. The Government of British Columbia is losing a large amount of stumpage owing to the fact that the rougher class of timber is at present left in the woods there to rot or burn up.

One-third of the cost of logging is incurred in putting in skid roads and this rougher timber could be taken out if there was any demand for it, but the majority of the loggers to-day are forced to leave it in the woods, where it must inevitably go to waste, a complete loss to the country and to the logger, who is unable to get the profit he would obtain under an open market on this class of timber ; and besides he is unable to use his skid roads and other necessary improvements to the fullest extent, thus losing a considerable portion of the returns he should receive for his outlay in road building, etc., which is, as shown, a heavy item of the expense necessary to procure logs, as all practical loggers and woodsmen know. In all common sense why not sell this timber to the Americans ? They have an unlimited market, can saw and sell timber that is worth nothing to us and will be worthless for many years. The logger will profit, for it will allow him to log and sell his entire limit and give him a larger and steadier market. The workingman will have employment all the year at good wages. The tug owners and all their employees will be busier than ever before. Vancouver and the whole Coast of British Columbia will at once feel the effect of the good American money put into circulation here.

We are told that we must protect the mills of this country by not allowing the export of logs. Now, in common sense what benefit is it to the mills to keep logs in British Columbia that they don't want and cannot cut and find a market for ; they have tried hard to have a duty put on lumber but without effect, they simply say they will not bid on a boom of rough logs as they do not want them.

This being the case, and it is the case, as anyone familiar with present conditions knows, why not sell to the United States at a profit what we cannot use at home.

There is also another phase of the question that has not been touched upon heretofore and it is this: The average cost of logs delivered at Vancouver or similar points is $5.00 per M., paid out for supplies, wages and towing, all going into the pockets of white men and freely circulated through the community. The cost of sawing these logs into rough lumber is approximately $1.75 to $1.85 per M., if cut in a modern and well equipped mill. Of this amount at least 50 per cent. goes to pay for Chinese, Japanese and similar labor who are of little value to this country, if indeed not a menace to our entire social system, leaving proportionately 85 to 90 cents per M. in payment to white labour and for supplies. We are asked to sacrifice a $5.00 industry to protect a 90 cent one, and further I think that it has been clearly shown that the 90 cent industry rather than suffering by export will really benefit.

We have no quarrel with the millmen on this question ; we only ask the Government of this country for common fair play outside of a combine. If the mills here cannot buy our logs at a living price then let us sell to those who will ; that is all we ask, and is it too much ? But says a critic, "we hear that the United States camps are shutting down, that there is an overproduction of logs in the State of Washington, how can you sell your logs there when the United States logger cannot, and you with the disadvantage of a 50 cent greater tow." Just briefly we will put that question to rights. On the American side stumpage is $1.00 to $2.50 per M., here 50 cents, an advantage of from 50 cents to $2.00 per M., also we can log a great deal cheaper owing to the greater amount of virgin territory and the shorter haul. In other words, we have vastly more timber than the State of Washington and it is closer to the water.

Also the loggers of the Sound, being wise in their day and generation, have formed a very strong association and sell their logs at a stated price according to the grade ; if the market is overstocked they shut down their camps until it has righted itself, but still hold up the price.

And right here it may be said that if the British Columbia Loggers' Association is to be an institution of strength and a support to the logger at all times it must be reorganized on a new and stronger basis. When the need for action arises, as at the present time, it requires a long period of depression to bring them together with a united front. Something on the same lines as our Yankee friends have formed is required, modified and changed perhaps in minor details to suit the different conditions existing here.

To continue, however : Those who are fortunate enough to hold Crown granted land in British Columbia secured subsequent to 1887 are now exporting their logs to the United States, and it is common knowledge that the price nets them from $1.00 to $1.50 more than the same grade here, the strong point being, however, the possession of a larger and steadier market, and their scale is 15 per cent. better than we get in British Columbia.

Another reason for cutting the timber and converting it into cash instead of saving it for

future generations of Japs and Chinese to work up in the sawmills, is that as most people are aware there is in say a period of ten years more timber in the forest consumed or destroyed by fire than there is cut down and converted into logs in a similar period, so that delay in getting out the timber and turning it into cash is destroying the chances of getting a considerable portion of it hereafter. Besides, we are naturally more interested in the living present than in fifty years hence, and when that time does come or perhaps much sooner the use of timber may be greatly curtailed if not done away with almost altogether, for in this era of invention and progress we find that iron, steel, and other substitutes are now used where formerly lumber was used altogether. It seeme strange to think how our friends, the mill men, keep on telling the people and the Government that there is not much timber in the country and that it export of logs is allowed there will soon be nothing left for the mills here to saw. And they have told this so often and so persistently that some of them seem to half believe it themselves, whilst the facts are there is more timber in this province than the mills here will saw up in the next 300 years.

There is, it is said, more timber on Vancouver Island alone than the Coast mills of British Columbia would saw up in the next fifty years. There is plenty of timber here for this generation and there will be plenty for the next.

The old saying "where there is enough, take enough, and where there's little take all," may have some vulnerable points, but there is lots of horse sense in it when applied to something like standing timber, which is liable to rot, burn, or depreciate in other ways.

Besides, it is foolish to get jealous because our Yankee cousins get our logs and give us in return their gold. Their money is what we want; this is bringing in capital and is better for the community than selling to people here, for selling to each other is like taking money out of one pocket and putting it into another as far as benefitting the public is concerned.

These are straight facts which will appeal to sensible people. We believe the rescinding of this Order-in-Council will have the immediate effect of putting life in the logging business, will double the value of our timber lands, will double the Government receipts for royalty and licenses, will give us all new hope and added energy.

This is not only of moment to us, it concerns every man, woman, and child on the Coast of British Columbia. We want your help, sign the petition, get your neighbour to sign it, help us, tell our city members that we mean business, and impress upon the Government of this Province the fact that we want legislation not for the few but for the many.

All of which is respectfully submitted on behalf of

The B.C. Loggers' Association,
W. H. Higgins, President.

Vancouver, B.C., June 25th, 1904.

W. Oliver has his new planing mill at Lethbridge, N.W.T., now in operation.

MANITOBA AND NORTHWEST LETTER.

Office of the Canada Lumberman,
McIntyre Block, Winnipeg, July 19th, 1904.

There are indications on all sides of great activity in the lumber business. Building operations are going ahead with unprecedented expansion, and as the demand for small property is greatly to the front, and mostly wooden houses, the impetus given to the lumber trade is very marked. This, however, in itself does not always mean that an industry so affected is of necessity in a financially flourishing condition and in this instance, although the volume of trade being done is eminently satisfactory, generally speaking, there is a good deal of dissatisfaction and the dealer especially is finding it difficult to show profit on his trading.

The previous season was a specially good one, and this year opened up with most dealers carrying an extra heavy stock in prospect of active demand, and in many cases more than they themselves considered advisable, but they were influenced by the zeal and anxiety emanating from the transportation companies. These stocks are mostly held at last year's prices, which it was expected would maintain right through the present season. As this has not been the case, however, dealers are face to face with a somewhat serious if not embarrassing situation. In the more outlying districts in the Territorities the situation is perhaps more distinctly marked, on account of the opposition being more keenly felt, as we learn that carloads of lumber have come across the border consigned by American firms direct to consumers. The representative of these firms finding it impossible to get orders from the local dealers, did not hesitate to canvas the consumer, in order to make his journey pay expenses, and, as if this in itself were not enough, going so far as to sell at an even lower rate than was ruling "wholesale" on this side, thus bringing prices down to an almost impossible basis. It can therefore be easily seen that under existing conditions, although the bulk of trade is in every way satisfactory, the financial side presents a serious aspect, and many dealers will do well if they close the season's trade without a heavy loss, the question of profit being a remote possibility.

To the wholesale manufacturer the conditions are somewhat different or at least more modified. The keen point which competition has reached places him in a position to draw his supply of logs across the border to advantage, and so show a good average of profit. The disparity in price has peen ruling at about two dollars per thousand, a difference which is of so serious a nature that the British Columbia mills cannot see their way to attempt to meet it; in many instances they are offered the prices asked by United States firms but up to the present have refused to entertain business. We understand that already some of the mills are making their arrangements for short work, their present available stocks not warranting full running for next season.

Reports which have recently reached us from the States are of rather a more assuring character. There are indications of a revival in demand on that side and better prices are not altogether unexpected; on some grades quotations are already firmer. Should this prove to be general the situation will be somewhat relieved, but at the present moment, what with heavy stocks and impossible prices, the position calls for careful consideration.

The effect to British Columbia promises to be most serious, as the prospects for the fisheries are not reported as of the best, and with its two staple industries failing in one and the same season, the outlook must be indeed bad. Last year the fisheries were almost a total failure, but the lumber business was good and therefore came in to save the situation.

The Sprague Lumber Company, of Winnipeg, have just installed a new saw mill of the latest American horizontal type. It is expected to be in operation within a few days and will be the first to be worked in Canada. The capacity of this mill will be upwards of 100,000 feet per day. They have also put in a complete plant for electric light.

The British Columbia Mills, Timber and Trading Company, Limited, of Vancouver, have secured an attractive location on the grounds of the Dominion Exhibition which is to be held at Winnipeg from July 25th to August 6th, upon which they are erecting a large platform and there displaying five houses, built on their patented method with a lock joint, and factory-made on a special sectional principle. The houses they are showing are made of British Columbia lumber throughout, were constructed at their factory and sent forward ready for erection. This exhibit looks like being one one of the great attractions of the Exhibition.

LUMBER TRADE OPPORTUNITIES.

PIT PROPS AND MINING TIMBER.

Mr. J. B. Jackson, Canadian Commercial Agent for Leeds and Hull, England, writes as follows concerning pit props and mining timber:

"To show the extent of the business that may be done in pit props and mining timber in the mining districts, I have an inquiry from one colliery alone, who require for the current year as follows:—

Pit props, 500,000 from 5 ft. to 7 ft. long, but principally 6 ft. and not less than 6 in. diameter at the small end.

Pine timber, 7 in. to 8 in. square in 15 ft. to 30 ft. lengths; 70,000 cubic feet.

Pitch pine, 12 in. square, long lengths; 20,000 cubic feet.

Oak in logs, about 12 in. square; 5,000 cubic feet.

Railway sleepers, 9 ft. x 10 in. x 5 in.; 3,000.

Pine deals, battens and boards; 150 standards.

This colliery company and others desire to be put in communication with sellers of the above classes of timber in Canada."

SAW MILL MACHINERY CATALOGUES WANTED.

Mr. D. H. Ross, Melbourne, Commercial Agent for Victoria, South Australia, Western Australia and Tasmania, Aus., writes:

"A practical saw-mill manager left here last week for London and, from there, proceeds to Canada to secure improved machinery for some mills in which he is interested in New Zealand. He has been supplied with the names and addresses of some Canadian manufacturers and will personally select his requirements. This machinery will be erected in one of the principal lumber centres, and should prove to be a good advertisement to the makers. As intimated in previous reports, it would be to the undoubted advantage of Canadian manufacturers of saw mill machinery if they would distribute their catalogues and export price lists broadcast throughout the Commonwealth to mill proprietors."

WOODEN PAVING BLOCKS.

Mr. P. B. McNamara, Commercial Agent at Manchester, Eng.:

"Many of the streets of Manchester are paved with wooden blocks of Australian wood, called Karri, of dimension 9in. x 5in. x 3in. planed and trued. The ast order given by the corporation was for 260,000 blocks, to a firm in Liverpool, and the minimum price paid was £12 10s. to £13 per thousand blocks f.o.b. Manchester. The wood is cut into blocks of the required dimensions in Australia, and shipped to Liverpool ready for use on streets. The wood resembles in weight and textility our Canadian iron wood, and as that is principally used for firewood, it proves expensive fuel, if it could be placed here for street paving at prices given above. The ocean freight rates are also in favour of Canada, as the wood can be shipped direct to Manchester by the ship canal from Montreal in summer, and from St. John or Halifax in winter."

RAILWAY TIES.

Mr. A. Poindron, Commercial Agent at Paris, France, writes as follows:

Dimensions of the railway ties mostly in demand in France are the following:

1st. 8 ft. 10⅜ inches long by 8⅝ inches wide by 5½ inches deep for square ties.

2nd. 8 ft. 10⅜ inches long by 11⅞ inches by 6 inches for half round or sided railway ties.

Duty rate is 1.50 fc. (about 29 cents) per 100 kilos (lbs. 220).

Present price, f.o.b. on cars, Havre station, duty paid, is about 3.50 fcs. each (nearly 67 cents).

The Adirondack fires of a year ago are discussed in a paper by Mr. H. M. Suter, of the U.S. Bureau of Forestry. Those fires, asting from April 20 to June 8, burned over 600,000 acres of timber land, and caused a direct loss of $3,500,000 sterling. About $175,000 was spent in fighting them, and they were finally extinguished only by heavy rains. Their effect on several industries was severe.

ADVERTISING RATES ON APPLICATION.

THE CANADA LUMBERMAN is published in the interests of the lumber, wood-working and allied industries, being the only representative in Canada of these important interests. It aims at giving full and timely information on all subjects touching these interests, and invites free discussion by its readers.

Especial pains are taken to secure for publication in the WEEKLY LUMBERMAN the latest and most trustworthy market quotations throughout the world, so as to afford to the trade at home and abroad information on which it can rely in its operations. Subscribers will find the small amount they pay for the CANADA LUMBERMAN quite insignificant as compared with its value to them. There is not an individual in the trade, or specially interested in it, who should not be on our list, thus obtaining the present benefit and aiding and encouraging us to render it even more complete.

Advertisers will receive careful attention and liberal treatment. For manufacturing and supply firms wishing to bring their goods to the attention of owners and operators of saw and planing mills, wood-working factories, pulp mills, etc., the CANADA LUMBERMAN is undoubtedly the cheapest and most profitable advertising medium. Special attention is directed to "WANTED" and "FOR SALE" advertisements, which are inserted in a conspicuous position on front page of the Weekly Edition.

OVER-PRODUCTION AND PRICE-CUTTING.

If the lumber manufacturer could always follow his inclinations, it is probable that there would be less cause for complaint on the ground of over-production. Unfortunately, he is not always fully in control of his business, and must sometimes operate his logging camp and his mill whether or not he can see a profit in doing so. Nevertheless, the evils of over-production have at different periods been strikingly brought before Canadian lumbermen and every effort should be made to minimize as far as possible the probability of such a condition arising. The present demoralized condition of the lumber industry in British Columbia is due in part to over-production, although the unfavorable tariff laws have also contributed largely to that end.

At this season of the year preparations are being made for work in the woods, and we strongly advise the adoption of a conservative policy on the part of all operators. We do not anticipate that there will be a falling off in the quantity of Canadian lumber required for home consumption and for export, but it is the part of wisdom to so regulate the output, if such is possible, as to prevent a decline in the market price even if the demand should prove disappointing. One of the most certain ways to accomplish this end is to curtail logging operations. These remarks are especially applicable to the spruce territory, where present conditions from a price standpoint are somewhat demoralized. The decline of from $2 to $3 per thousand feet which has taken place has practically left the manufacturer's profit a nonentity, and it is therefore very necessary that the coming season's work in the woods should be planned with extreme caution. We would suggest that the lumbermen of Quebec, New Brunswick and Nova Scotia form an association with the object of making an arrangement whereby the maximum production will not exceed the probable consumption. This policy has been adopted by the Swedish and Finish mill owners with some success.

Price-cutting is another source of demoralization to the lumber trade. Uniform prices are a sure indication of healthy conditions and inspire a feeling of confidence in buyers. The person who requires lumber is always willing to buy at the market price if he can be assured that the basis will be steadily maintained and that his competitor will not be given an advantage over him. When price-cutting is indulged in the reverse is the case.

Under ordinary circumstances price-cutting below the average selling value provides but a temporary increase of business. A lumber salesman may succeed in selling a block of stock by giving exceptional inducements, but upon his next visit the customer so favored will in all probability demand a further reduction from the previous cut price and refuse to buy if a concession is not granted. He has become imbued with the idea that the undertone of the market is weak, and is therefore doubly cautious in making purchases. Had the cut price never been granted he would be a more willing buyer.

THE DEMAND FOR AN IMPORT DUTY.

The agitation for an import duty on lumber coming into Canada is now more pronounced and widespread than perhaps at any previous time in the history of the trade. In every province of the Dominion, with the exception of Manitoba and the Territories, the justice of the demand of the Canadian manufacturers is recognized. There is likewise a greater probability that the lumber trade will be accorded the protection which has been asked. A deputation of the Lumbermen's Association of Ontario recently interviewed Hon. W. S. Fielding, Minister of Finance, on the subject, and while no definite promise was made, they were given some reason to expect that the conditions would be remedied in the near future.

At this time the tables of imports and exports of forest products published on another page are peculiarly interesting, showing as they do that the question of an import duty on lumber is a much more important subject than is generally believed. Taking the month of May for comparison, the imports of forest products into Canada, according to the unrevised monthly statements issued by the Department of Trade and Commerce, were valued at $625,382, while the exports of forest products from Canada in the same month were $1,062,054, or less than double that of the imports. While we are not disposed to accept the figures as absolutely correct, the Department itself not making such claim, they at least reflect in a measure the relation which the imports bear to the exports, and refute the statement which is sometimes made that our lumber imports are insignificant in volume. The figures for the previous two months show the value of forest products imported to be still nearer that of the exports.

The lumber trade have asked for and expect an import duty. Until such duty becomes law, the "dumping clause" embodied in the recent tariff introduced by the Minister of Finance should in some way be made applicable to lumber, notwithstanding that it is not designed to apply to free goods. This clause provides that when any imported article is sold in Canada below the market value for home consumption in the country of export, there shall be levied thereon in Canada, in addition to the ordinary duty established by the Canadian tariff, a special duty equal to the difference between the selling price and the fair market value for home consumption, provided, however, that such special duty shall not exceed one-half the ordinary duty provided by the tariff. It is well known that large quantities of United States lumber have been sold throughout the Canadian North-West below the actual selling price of such lumber in the United States, and the dumping clause should be at once enforced to prevent Canada from being any longer made the slaughter ground for United States manufacturers.

It is estimated that ninety per cent. of the imported lumber has come into Canada free of duty, as the Customs Tariff in the case of lumber sized one side and one edge has been violated by United States manufacturers, who, to avoid paying duty on it, first plane their dimension lumber on one side and then pass it over a fine-toothed rip saw to size it on the edge, while the Dominion Customs Tariff distinctly provides that an ad valorem duty shall be levied on all lumber when further manufactured than dressed on one side. As a result of representations made to Ottawa, we understand that the Government have notified the customs officers to collect duty in future on all dimension lumber planed on one side and edged by fine-toothed saws as above mentioned.

As showing that the lumber manufacturers of Canada have not been getting undue prices, it is pointed out that very few mills have been dividend payers, whereas a considerable number of persons who have embarked in the business have experienced failure. It is not the purpose of the trade, however, to advance lumber prices as the outcome of an import duty, but rather to create a market for the output of the mills, many of which as conditions now exist can be operated only for a short period in the year. At a meeting of the lumber and shingle manufacturers of British Columbia, held in Vancouver recently, a resolution was adopted pledging themselves not to increase the price of lumber in consequence of the protection afforded by a duty.

INCREASED CONSUMPTION OF LOW GRADE PINE.

An interesting feature in the lumber trade of the past year has been the heavy demand for all grades of white pine below common. The manufacturers in both Canada and the United States have experienced no difficulty whatever in disposing of all the lower grades, while the upper grades have not shown corresponding strength and were the first to recede in price when market conditions became a little unfavorable about six months ago. Coincident with the strong demand for low grade pine came an increased consumption of hemlock for building purposes. It would seem, therefore, that there

has been an abnormal consumption of lumber of the poorer quality, this probably being the outcome of the prosperous conditions existing in the country districts and of the general commercial prosperity as reflected in an increased demand for boxes for the shipment of merchandise.

There is little indication at the present that there is to be an immediate slackening of any consequence in the demand for low grade pine, which condition must be very gratifying to the lumber trade at large. The percentage of low grade stock produced each year is increasing, but the demand is likewise expanding.

EDITORIAL NOTES.

Railroad cars will be scarce when the crops begin to move, then order your lumber before the fall freight blockade.

Many a good word is now said about hemlock lath, where a few years ago it was almost unknown as a market commodity. It can be purchased at $2 per thousand for No. 1 at the mills, which is about the same price as No. 2 white pine. A comparison of qualities results, if anything, in favor of the hemlock, and its still greater use may be expected.

The Union Pacific, Great Northern and Northern Pacific Railroads have decided not to grant the extension of the 40 cent fir rate into the Missouri Valley as requested by the Pacific Coast Lumbermen's Association. The refusal of this concession is a sore disappointment to the lumbermen of the Coast states, as it would have undoubtedly been of material assistance in reducing some of the immense stocks of the lower grades they haye accumulated. The lumbermen of British Columbia will regret to hear of the decision arrived at by the railway magnates, as they hoped to gain relief from the ruinous competition they have been subjected to during the past six months by the free importation of these stocks into the Territories and Manitoba. It is estimated that the Missouri Valley consumes 150,000 cars of lumber annually.

Mr. G. Eustace Burke, Commercial Agent at Kingston, Jamaica, British West Indies, has taken a step which should strongly commend itself to Canadian manufacturerers and exporters. Recognizing that a very small percentage of Jamaica's importations are supplied by Canada, he has established a permanent exhibition and sales room wherein the manufacturers of Canada may exhibit their goods. The charge for space is at the rate of $2 per square foot, with a minimum charge of $20 per annum, but special arrangements can be made for exhibiting furniture, lumber, etc. The charge for wall space is $1 per square foot, with the privilege of commercial literature in the reading room and library. Messrs. Pickford & Black have expressed their willingness to convey all exhibits free of freight charges from Halifax to Jamaica. It is earnestly hoped that Canadians will take advantage of this unique opportunity to make their goods known to probable customers in that market.

CONCATENATIONS.

A successful concatenation was held in Orilllia on Friday evening, June 24th, when thirty-one kittens were introduced to the kindly light of Hoo-Hoo. This was the first gathering of Hoo-Hoo in Northern Ontario. The lumber trade was represented by an attendance of seventy-five members from many towns and cities in various parts of the province. The old members of the order are always interested in seeing that the candidates are well and properly concatenated and that no detail in the ceremony of initiation is overlooked. There was no complaint made at Orillia on that score—certainly not from the kittens. The local committee had arranged for the continuous entertainment of the visitors and the programme was thoroughly enjoyed. Early in the evening the party enjoyed a sail on Lake Couchiching on the steamer Longford.

The new kittens after their initiation were honored by an elaborate banquet at the Orillia House. The menu was printed on thin boards and each was decorated with a boquet plucked from the onion bed. There was not a dull moment and all expressed their appreciation of the kind entertainment in Orillia, and congratulated the Orillia committee on the thorough success of this meeting.

A concatenation will be held in Winnipeg during exhibition week, the exact date of which had not been announced at time of going to press. Mr. J. S. Spencer, care of the Clarendon Hotel, Winnipeg, has been appointed Scrivenoter and is receiving applications from canditates. A large class is likely to be initiated, as it will probably be the last initiation of the season in the district. The Vicegerent Snark of the Western District is G. B. Housser, of Portage la Prairie.

ENQUIRY FOR HOO-HOO MEMBER.

The Supreme Scrivenoter of Hoo-Hoo, J. H. Baird, of Nashville, Tenn., is very anxious to learn the present address of Mr. Howard Benton, Hoo-Hoo No. 1736, formerly of Washburn, Wis. The Scrivenoter has some very important mail for this man. Mr. Benton is 30 years old, is 6 feet tall, weighs 185 pounds, has iron gray hair and brown eyes, is well educated and of good appearance. He was county judge at Washburn for eight years. In the 1900 handbook Mr. Benton is put down at Washburn, Wis., with the W. B. & I: Railroad. Any one who can furnish information in this connection will please write J. H. Baird, Wilcox Building, Nashville, Tenn.

BURNING OF THE HOUSE OF HOO-HOO.

All Canadian lumberman, and members of the mysterious order in particular, learned with regret of the burning of the House of Hoo-Hoo at the World's Fair, St. Louis, on Friday morning, June 24, just after the magnificent building had been completed. The loss was about $60,000. It was one of the most unique buildings and the only club-house on the grounds and was admirably adapted for the purpose for which it was designed.

The building was partially insured, and the Executive Committee held a meeting only a few hours after its destruction, and after careful consideration of the situation, and encouraged by many letters and telegrams proffering aid for rebuilding, they decided upon the reconstruction of the building within the shortest possible space of time. The contract was awarded on June 27th and active work under it was started the following day. Dedication ceremonies were announced for Monday, July 25th, but the Executive Committee afterwards found that the new building was so far advanced that it could be dedicated on the afternoon of July 23rd. A large number participated in the ceremony and on all sides were heard expressions of satisfaction that the building had been so quickly rebuilt and that so little inconvenience had resulted through the burning of the original structure.

Supreme Scriventor J. H. Baird, Nashville, Tenn., is very anxious to make a good showing at the St. Louis annual meeting in the matter of paid up dues. There are now nearly two thousand members of Hoo-Hoo still owing dues for the year ending September 9, 1904, and this notwithstanding the fact that two formal notices have been sent out from the Scrivenotor's office. The constitution requires that a man shall be sent three formal notices before he is suspended, but no good Hoo-Hoo should wait to have that much postage expended on him. Every member who has not paid 1904 dues should send in the amount at once and not wait until he goes to the annual meeting. The Scrivenoter will have all he can do at the annual meeting without having to handle any dues. Everybody will be in a rush and everybody's time will be very much occupied—do not add to the confusion by going to the Scrivenoter's private office at the official headquarters and buttonholing him while you try to pay 99 cents out of a twenty dollar bill. Of course, the Scrivenoter will cheerfully accept your money at the annual meeting if you cannot possibly make shift to pay him sooner, but you will add greatly to his comfort and smooth matters generally by sending in your 99 cents right away. You need not trouble to buy a post-office order or send currency by registered mail—your personal check will be good enough. Any form of remittance goes except stamps that are stuck together. He draws the line at that.

A TRADE CIRCULAR.

Following is a copy of a circular which the Bonsack Lumber Company, St. Louis, Mo., sent in advance of all their salesmen on their last trip:

STRIKE

Mr. Meyer has struck for more money and less work. We are willing to concede both points, providing he can secure more orders. Now, should he strike on you, would advise not to arbitrate, but give him an order, otherwise we cannot be responsible for results, as we are informed hot air is as dangerous under certain conditions as dynamite. We trust that he strikes you in want of lumber and that it will strike you that he ought to have the order. Mr. Meyer says he is no "scab," but a first-class salesman. As we are from Missouri, he must "show us" more orders before we can grant his demands. Respectfully,

THE BONSACK LUMBER CO.,
Hardwoods, Saint Louis.

He will call on you to-morrow or day after.

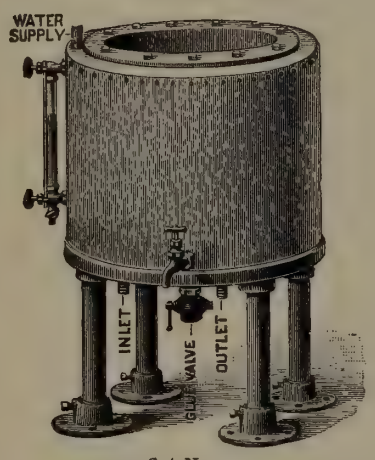
ONE WAY OF ESTIMATING TIMBER.

There are several methods of estimating the amount of standing timber on a given tract, and the following which is in use in states that have been ranged and sectionized, is as good as any :

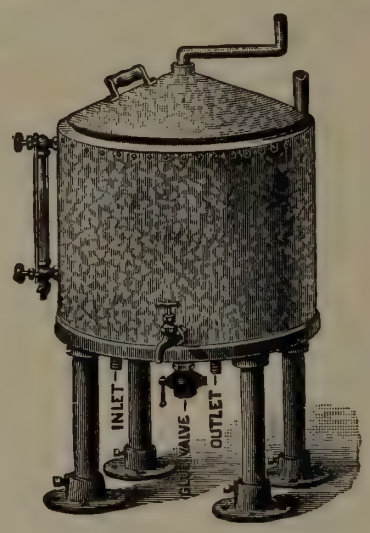
Three hundred and thirty feet, which is one-fourth the distance along one side of a square containing forty acres, is called a "tally." This is equal to 125 paces of a good walker with a good pair of legs, or about 140 paces of an ordinary walker. The estimator, called timber cruiser in some parts, is accompanied by a compass man, who ought to be an experienced woodman. Assuming that a quarter section is to be estimated, and that it is convenient to begin work at the southeast corner, the estimator calls to the compass man, "Go west." The compass man, starting from the corner, goes west 125 steps, more or less, according to the known length of his step, halts and calls out, "One tally west." The estimator calls, "Go north," and the compass man goes north the requisite number of steps and calls, "One tally north." The estimator goes to work by covering the 2½ acre squares on either side of the compass man's line to an estimated distance of 125 steps in each direction. He then estimates for each important species the number of merchantable logs to the tree, the average number of logs to the 1,000 board measure feet, and the total number of merchantable trees on the five acres covered. To aid in doing this he counts, perhaps several times a day, all the merchantable trees on average acres or quarter acres, stepping off and blazing a line around the acres and counting all the trees inside the lines, or he will stand in the centre of a one-quarter acre circle and count all the trees within a radius of sixty feet. This process gives the estimator a pretty correct amount of timber of each kind. This process is repeated until the entire tract is covered. The estimator makes a careful note of the character of the land and the probable cost of logging. Two good men can cover one quarter section a day, weather and other conditions being favorable.—Southern Lumberman.

IMPROVED APPLIANCES FOR

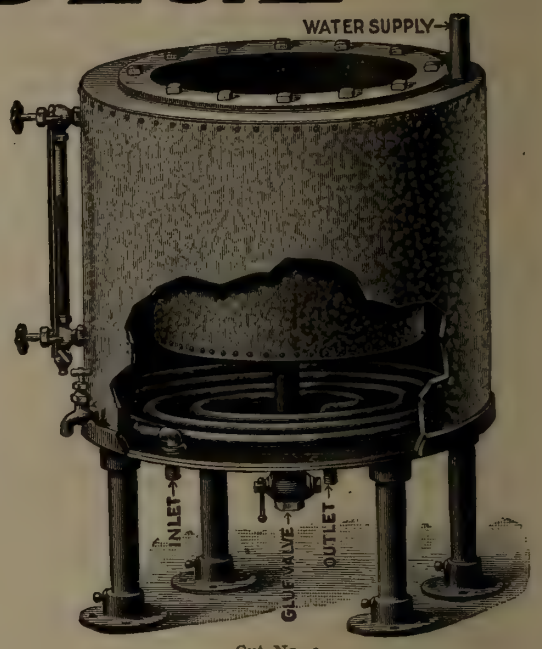
HANDLING GLUE



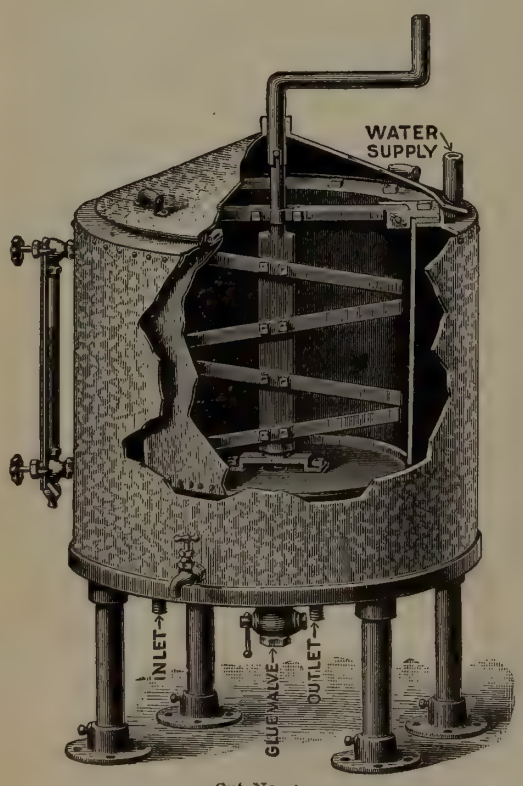
Cut No. 1.
No. 61 BOILER.



Cut No. 2.
No. 61 BOILER.
With heavy galvanized iron lid, fitted up complete with Glue Stirrer.



Cut No. 3.



Cut No. 4.

STEEL GLUE BOILERS OR COOKERS (Galvanized)

Cut No. 1, 6 gallon Steel Glue Boiler, and cut No. 2, same Boiler with Heavy Galvanized Iron Cover and arranged with Glue Stirrer. Cut No. 3, a 20 gallon Boiler or Cooker, No. 63, giving a sectional view, showing arrangement of Copper Tube Coil for heating the water.

Cut No. 4 shows a No. 63 (20 gallon) Boiler or Cooker with Heavy Galvanized Iron Cover and sectional view showing arrangement of Glue Stirrer.

Made of Heavy Sheet Steel, both Water Jacket and Glue Pot well Galvanized. The Steam Pipes are connected to a Coil of Heavy Copper Tubing ; in this manner the water is quickly heated and the steam can be piped back through trap to steam boiler, thus causing very little loss of steam and overcoming all danger of bursting the Glue Boiler, as all steam pressure is confined to the Copper Tubing. Other features are fully described in our catalogue of **Modern Glue Room Appliances.** If interested,

WOOD PULP DEPARTMENT

TEXTILES FROM WOOD PULP.

Artificial silk made from pulp is now a staple on the market, and the demand is greater than the supply, according to the statements of those who are engaged in the business.

We are now to have an extension of the field of the pulp maker, and by means of recent discoveries and improvements practically the whole range of textile work is opened to him as a market for the disposal of his raw material. Recently the Paper Trade Journal gave a somewhat lengthy notice of a book writen by Professor Pfuhl, of Riga, Russia, in which that writer reviews the work that has been done in the way of making wood pulp available for textile work. He gave it as his opinion that Kron had outstripped his fellow workers in the same field and had made progress sufficient to demonstrate practically that the yarn for any kind of textile could be spun directly from moist wood pulp, an advantage which was not possessed by the methods of other inventors. It is claimed that by Kron's method there is produced not only a stronger yarn but that the cost of production is less and that the output is greater.

AUSTRALIA WANTS CANADIAN PULP.

In a report to the Department of Trade and Commerce, Ottawa, Mr. D. H. Ross, Canadian Commercial Agent at Melbourne, Australia, says :

"Samples forwarded to this office by Canadian manufacturers of pulp have been submitted to the local paper mills, but I regret to report that nothing suitable for local requirements has, so far, been received. The local mills require sulphite (not mechanical) pulp, in unbleached and bleached sheets, packed in bales weighing about 3½ cwts. The unbleached pulp is used in the manufacture of brown wrapping paper, which industry is protected by a customs duty of £3 (say $14.60) per ton. The bleached pulp is required for strong cartridge papers, etc.

"The Melbourne Paper Mills use local materials in making a substitute for cheap ulp, which answers for 'filling' purposes. It is essential to make a dry pulp, equaling in quality that now received from Norway and Germany, in order to obtain a footing in this market. An experimental shipment of Canadian pulp came forward to this city some years ago, but owing to its dampness, the contents of the bails—especially in the centre of the packages—was rotten when it arrived.

"The landed cost of the last shipment from Norway,on Melbourne Wharf, was as follows : Unbleached pulp, £10 (say $48.66) ; bleached pulp, £11 ($53.53), per ton of 2,240 lbs. The landed cost, of course, fluctuates according to the market, and the freights obtainable at time of shipment. The manager of the local mills expresses a desire to obtain his supplies from Canada, and it is to be hoped that an effort will be made to secure the orders offering. If suitable dry pulp can be produced by Canadian makers, it is probable that the authorities will waive the present customs regulation which requires the sheets to be perferated in order to allow the line to land duty free.

"By this mail I am forwarding fresh samples of continental pulp to the Department of Trade and Commerce. The Melbourne Paper Mills will import from 1,000 to 2,000 tons of dry pulp this year, and it may be stated that there are larger mills in an adjoining state."

THE CANADIAN PULP PRODUCTION.

Mr. George Johnson, Dominion Statistician, furnishes the following particulars of the pulp production in 1903 :

The wood pulp industry of Canada for the calendar year 1903 was carried on by 39 mills which had an output of 275,619 tons of wood pulp. Of this quantity, 187,871 tons were mechanical pulp, 84,808 sulphite and 2,940 soda. The corresponding quantities for 1902 were : Mechanical, 155,210 tons ; sulphite, 76,735 tons, and soda, 9,044 tons. This shows an increase of 34,630 tons in 1903. The increase is distributed : Sulphite, 8,073; mechanical ,32,661 tons; soda showing a decrease of 6,104 tons. The total value of the output of 1903 was $5,219,892. There are several large mills in course of construction, or which, being finished, did not operate during the year 1903. Two or three firms have gone out of business or manufacture only paper where before they made pulp.

Nine of the thirty-nine mills manufacture sulphite pulp and three soda pulp. Twenty-seven manufacture mechanical pulp and five make both chemical and mechanical. Taking the returns of thirty-nine mills, the average time the mills ran during the year was nearly nine months. The value of the production was $5,219,892, the amount exported $3,013,-441, leaving $2,206,451 for home use. In a general way, therefore, we export about 57 per cent. of our production. Of the $3,013,-441 worth exported by Canada in 1903, Great Britain tok $865,826, the United States $1,-890,448, and other countries $248,167.

NEW SULPHUROUS ACID PROCESS.

A new process for making the acid used in sulphite mills has been patented by Paul Drewsen, of New York, and John Parent, of Shawano, Wis., and for some time past has been in practical operation at the mill of the Wolt River Paper and Fibre Company, Shawano, Wis., U.S.A., in which Mr. Parent is engaged. The process is so simple and does away with so much expense in first cost and subsequent maintenance, that competent sulphite men who have examined it say it will simply revolutionize present acid-making methods. The apparatus consists simply of a wooden box of size suitable for the amount of acid to be made, provided on the bottom at frequent intervals with agitators. The milk of lime enters the box at one end, and the sulphur gases at the other. The agitators make between 400 and 500 revolutions, and produce a very violent commotion in the liquid, throwing it up against the top of the box and offering a great absorbtion surface for the gases to reach. From five to ten minutes' treatment is all that is required, and the acid flows in a continuous stream out of the box. The process is in every way continuous and automatic. When the machinery stops, the flow of liquor stops, and no milk of lime can run into the acid. There is also no chance for the settling of lime and monosulphite of lime. There are no pressure or vacuum pumps, no large tanks, very little power, and no expensive help. A company known as the Drewson-Parent Construction Company has been formed to exploit the new invention. Paul Drewsen, of New York, is president ; John Parent, of Shawano, vice-president ; and F. E. Lucke, of Shawano, secretary-treasurer and manager.

PULP NOTES.

J. R. Booth, of Ottawa, intends building a paper mill in connection with his pulp mill.

The ratepayers of Chatham, N.B., have decided to grant exemption from taxation to the mills and properties of the Maritime Sulphite Fibre Company at that place.

The St. John Sulphite Pulp Company, whose mill is at Mispec, N.B., is to wound up, E. B. Ketchum having been appointed liquidator. English capitalists are the chief stockholders.

Thomas McCormick has succeeded C. W. Rantoul as manager of the Imperial Paper Mills Company at Sturgeon Falls, Ont., and it is understood that the extension of the mills will be proceeded with.

The Jenckes Machine Co., of Sherbrooke, Que., have acquired the sole right to manufacture for the Canadian market the screwless screen plate holder, invented by the Blaisdell Screen Plate Co., of Oakland, Maine.

In connection with the recent charges of William Price against the Quebec Legislature and the Chicoutimi Pulp Company, it is reported that the latter has taken an action in the Superior Court against Mr. Price for $25,000 for alleged damages.

It is stated that the St. Raymond Pulp Company, of which Mr. Macfarlane of Montreal is one of the principal promotors, are about to construct new pulp and paper mills at St. Raymond costing $150,000, for which preliminary surveys have already been made.

Several of the Clergue industries at Sault Ste. Marie, Ont., have resumed operations under the re-organized company. The pulp mill is one of these, and it is said that there is a good demand for the output. The drying plant is not likely to be started, as experiments in that direction by the old company were not a success.

English capitalists will probably build the La Tuque branch of the Quebec and Lake St. John Railway, which has recently been subsidized by a land grant of 4,000 acres per mile by the Provincial Government. This road will, if built, be an important factor in the development of the pulp and lumber industry of the St. Marice district.

J. H. Wallace, hydraulic engineer and pulp mill expert, of New York, has been at Fort Frances, Ont., recently, making surveys for the power development and pulp and paper mills to be constructed at that place by the Backus syndicate. The plans call for pulp and paper mills on both sides of the river, the pulp mill to have a capacity of 125 tons daily, to be increased to 175 tons. The work of construction will be under the supervision of W. L. Bowker.

THE Wood-Worker and Retailer

UTILIZING SMALL PIECES.

A writer in The Woodworker submits the following as the best means of uti izing pieces that seem too good for fuel yet hardly large enough for anything else. I have a bin into which I throw all cuttings 10 inches and over in length by 4 inches and over in width. By this I mean all cuttings that will not make short panels or stiles and rails for panel work, drawer slides, backs or bottoms. I have a place for each kind of wood, also for each thickness. The only place to sort ends and save handling is at the cutter.

When I get this bin full of common ends, I have a load of No 4 common pine run in for long pieces or bottoms for the core bundles. This is surfaced two sides to 7/8inch and ripped to 4 and 6 inches wide. The common ends are also ripped and dressed to the same dimensions. I cut the long pieces to desired length and build up with these ends to desired thickness, being careful to place pine or other soft wood at both ends so it will be easy to mortise after the bundles are resawed and the stiles veneered. Am careful to break joints in building up the bundles, so as to make a strong stile.

SUGGESTIONS FOR THE PREVENTION OF ACCIDENTS.

A journal published in the interest of casualty insurance makes some practical suggestions, both to employers and employees, which, if adopted, would certainly lessen the awful list of casualties to life and limb caused by machinery in motion:

All belts passing through floors, or vertical shafting operating through floors, should be cased in to the height of at least 4 feet. See that belts do not have ragged places and that the lacing or hooking is O. K.

Shafting beneath machine tables and all other shafting operating on or near floor should be covered.

Loose pulleys should be used wherever possible, so as to throw a saw, jointer, shaper or other piece of machinery out of motion when not necessarily in use,and employees should be instructed to throw out of motion such machine when leaving same even temporarily.

Shifters should be used at all times for shifting belts, and no employee should be allowed to shift a belt with his hands or stick. Belts should be laced and adjusted when machinery is not in motion.

All flywheels of engines and belt wheels should be inclosed by casing in or placing substantial railings around them, either of wood or gas pipe. The latter is preferable and more substantial.

All bearings and other parts of machinery should be oiled and cleaned when not in motion, and no minor under sixteen years of age should be allowed to oil or clean machinery, or to sew or assist in sewing belts.

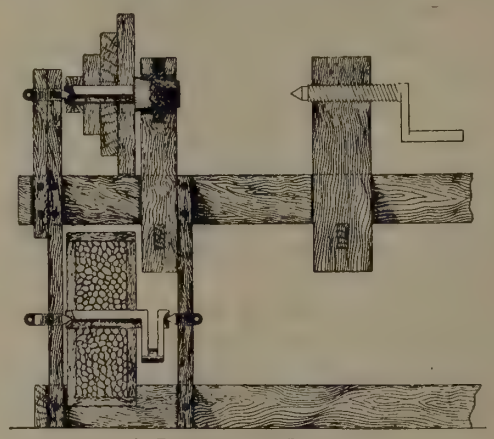
Low water alarm columns on boilers should be frequently tested to ascertain whether in good working order.

Setscrews in collars and couplings on line and counter-shafting should be covered, or, preferably,countersunk,so that the head of the screw shall not project above the surface of the shaft. Setkeys in hubs of fly or other wheels should be cut off flush with end of shaft or covered with tin casing or other materials fitting closely to shaft, forming a smooth surface.

All cog gearing should be completely cased in, casing to be so constructed that it can be easily removed when necessary to repair or oil; casing should be made of wood or metal.

A BACKWOODS LATHE.

The illustration herewith, taken from the American Machinist,shows what a correspondent calls a backwoods lathe. It was built by an couple of Wisconsin pioneers—one a handy man with carpenter's tools, the other a blacksmith—some fifty years ago. The balance wheel was simply a round box filled with stones. The tools were made from old mill files. With this lathe they made about 400 feet of well-drill rods in one winter.



A BACKWOODS LATHE.

SOMETHING ABOUT DRY KILNS.

The practice of kiln-drying lumber has become well-nigh universal. People in this fast age cannot await the old fashioned slow process of air-drying lumber,and no mill of any great capacity either in the pine or the hardwood section is considered complete without dry-kiln facilities equal at least to about one-fourth or one-third its capacity. While kiln-drying of lumber is the common practice, yet opinions as to its effect upon the strength and other qualities of the material are very much divided, and there are still many who prefer air-dried lumber. Nor is opinion unanimous as to the best manner of constructing dry kilns and the best process of drying. The process most widely used is the method of forcing air heated to as high as 180 degrees Fahrenheit through the dry house by means of fans or blowers. This process has also come in for the largest share of criticism. There are many who insist that subjecting lumber or timber for many hours to a temperatue of 150 to 180 degrees F. "kills" it, by which term they mean in a general way that the bending and breaking strength and resistance to compression is lessened. Experiments made by United States government experts go to show that this objection is not well founded. The many contradictory claims about closing the pores of the wood by long subjection to a high temperature, and its chemical effects upon the sap and its constituent parts, as albumen, gum, resin, sugar, etc., are not substantiated by the government tests. Neither are the claims of increased checking, wraping, "case hardening," "honeycombing" and many others. Well-constructed kilns of the blower type, where the hot air is driven in at the discharging end of the drying room and out at the receiving end, are giving entire satisfaction. But it stands to reason that too high heat and too rapid drying of lumber is not the best. Nature's process of drying anything is a slow one, and nature does most things well, and it is advisable always to follow her plans as nearly as time will allow and convenience will permit.

The best class of dry kilns seems to be those in which the piping is amply sufficient to insure a uniform heat,not to exceed 180 degrees,in all parts of the kilns, with a steady and moderate circulation of the air among the material. For timbers of large size kilns of this type are most generally preferred. All the standard dry kilns now on the market possess individual and peculiar advantages and the selection of one is largely a matter of individual preference and experience and special requirements.

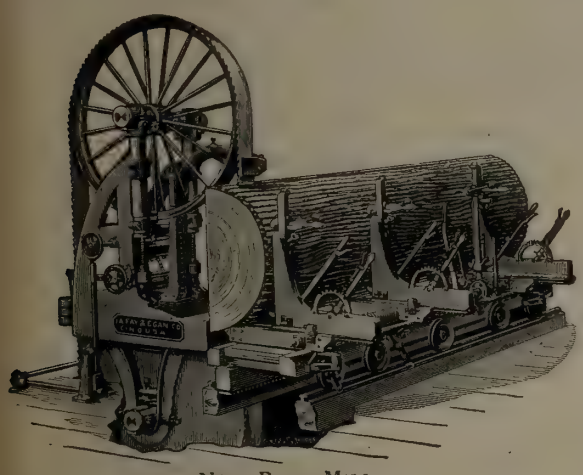
There is one class of dry kiln employed in some localities in which a temperature of more than 300 degrees F.is used under a pressure as high as 150 pounds, and it is claimed that such treatment results in increase of strength, durability, and absence of shrinkage. Teste made by the government do not appear to bear out these claims. Kilns of this type must needs be costly

to construct and difficult if not dangerous to operate.

A notion prevails widely that the soaking of wood by rafting or floating injures its strength but reduces its tendency to decay and skrinkage. The same is said of wood boiled or steamed preparatory to bending. Careful tests show that these claims are merely notions without any substantial foundation in fact.—Southern Lumberman.

NO. 57 BAND SAW MILL.

The most pronounced success in the development of machinery for the lumber manufacturer is the band saw



New Band Mill.

mill. Its superiori y over the circular mill is everywhere admitted. It required long and continued effort to bring the one here shown to its present state of mechanical perfection; with the result that on its introduction on the market it at once met with favor. It is one of the newest and most improved pony band mills for fine sawing in hardwood ever built. It was patented September 18th, 1900, and October 30th, 1900, and attention is invited to some of its most important points:

1. The great saving in kerf by using a thin blade, an important item when cutting fine lumber.

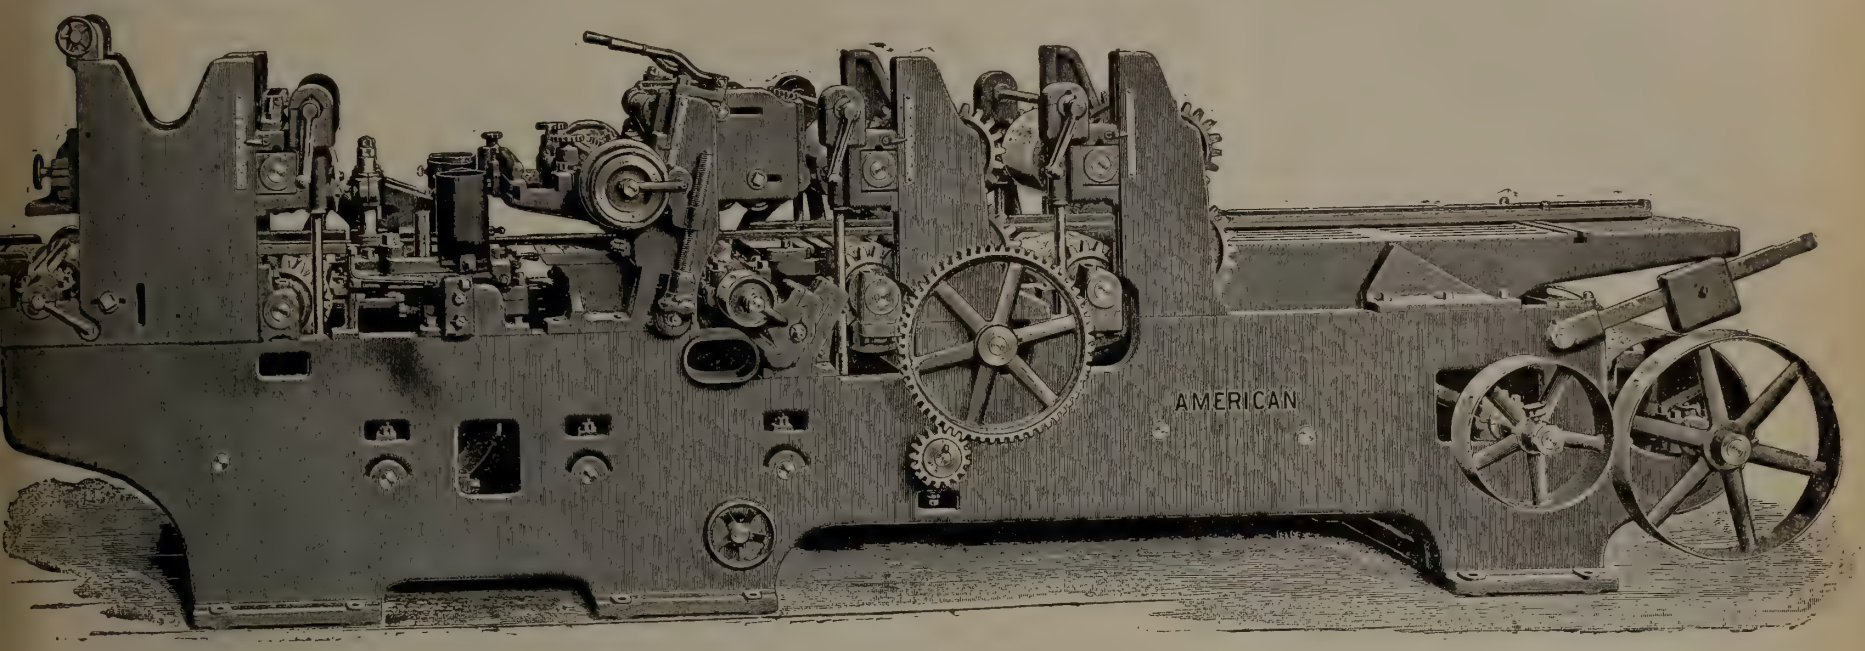
2. Solid lower wheel, increasing speed, lessening the circulation of dust, and preventing the upper wheel from overrunning it. Upper wheel having its spokes placed in staggering position, giving it increased solidity.

3. Improved sensitive straining device, maintaining an always even tension on saw blade, and materially prolonging its life.

4. Patent variable friction feed, simple in construction, powerful and effective in operation. Furnished for steam or rack and pinion.

5. Automatic off-set to carriage, headblocks fitted with Knight's patent dogs and having automatic receding device, double-acting set works, rapid return to carriage, etc., are a few of its improved features.

Those interested will be furnished with terms, full descriptions and any particulars, including copies of testimonial letters received from users, by the makers, J. A. Fay & Egan Co., Cincinnati, O. They will also send free their new illustrated catalogue of woodworking machinery to those writing for it, mentioning this paper.



Hoyt's New Five Headed Planer and Matcher.

HOYT'S NEW FIVE HEADED PLANER AND MATCHER.

The accompanying engraving illustrates a late improved five-headed planer and matcher of the New Series type, built by the Hoyt & Brother Company Branch of the American Wood Working Machinery Company, at Aurora, Ill. The main feature of this machine is that it has two lower cylinders. The first one is placed in front of the top head, making the roughing cut, while the second lower cylinder is placed in the rear of the machine, for producing an extra fine finish when running flooring face downward. It is built in various sizes, working from 9 to 30 inches in width, and 8 to 12 inches thick. It will match from two inches to the full width of machine and dress as thin as ⅜ inch.

The feed consists of six large rolls, geared at both ends and fitted with parallel lift. The rolls are either solid or divided as ordered.

The top and bottom cylinders are of crucible steel, four-sided, lipped and slotted and belted at both ends. As they are alike in detail, they are interchangeable. The journals are long and large in diameter. The boxes are yoked both in front and behind the cut, insuring perfect alignment. They are easily adjusted and rigidly clamped. The pressure is perfect, and the parts are so arranged that they permit of the knives taking in an exceptionally heavy cut. The pressure bar on under head is carefully designed, and while simple, yet is positive.

The lower cylinder is placed in front of the upper cylinder. It can be quickly and easily drawn out from the side of the machine, and is adjusted not only from the side, but also from the feeding-in end of the machine while it is in motion, to bring the cut of the knife on a line with the rear pressure bar. The front lower cylinder bar, together with the lower feed roll, is so arranged that by operating a lever at the front of the machine, the cut of the under head may be changed as desired without altering the finished thickness of the material or disturbing the cutter head, and any amount of stock can be removed up to ¾ inch.

The gearing is strong, positive and powerful. All gears of equal size are interchangeable and can be reversed, the hubs being alike on both sides. All gears and pinions are mounted on shafts which run in babbitted boxes.

The matcher spindles have long bearings and are large in diameter. They are adjusted independently and can be clamped perfectly rigid.

The top chip breaker can be adjusted to within ⅛ inch of the cutting circle, and remains in this relation even when the cylinder is taking any cut desired up to ¾ inch.

There are four rates of feed, 40, 50, 60 and 80 feet per minute, or the manufacturers can furnish any rate desired up to 120 feet per minute.

For full detailed information and prices, we would refer our readers to the American Wood Working Machinery Company, 136 Liberty street, New York, or the Fairbanks Company, Vancouver, B.C.

THE NEWS

ONTARIO.

—Conrade Forler is building a planing mill at New Hamburg, Ont.

—Currie & Thrasher are building a new saw mill at Deux Rivieres, Ont.

—H. Cargill & Son, Cargill, Ont., are building a new planing mill and sash and door factory.

—Charles Hopewell, of Ottawa, purposes establishing a sash and door factory in Winnipeg.

—Mr. Lottridge is establishing a new saw mill at Williams Bay, Lake of Bays district, Ont.

—J. R. Booth has completed his new lumber yard on Nepean Road, about four miles from Ottawa.

—John Todd, Collingwood, Ont., is considering the question of building a box factory in Owen Sound.

—Moses Stratton has sold his saw and planing mill at Staffordville, Ont., to Mr. Stafford, of Houghton.

—The ratepayers of Cornwall, Ont., will vote on a by-law to grant a loan of $17,500 to John B. Atchison to assist him in rebuilding his saw and planing mills.

—The Lake Superior Timber Company, Port Arthur, Ont., will ship this season about 25,000 cords of pulp wood, chiefly to Port Huron, Cleveland and Detroit.

—It is reported that the Imperial Lumber Company, of Toronto, have under consideration the establishment of a saw mill and lumber yards at Owen Sound, Ont.

—The Rideau Lumber Company, of Ottawa, are announced to have disposed of their mill property at Barry's Bay, Ont., to D. H. Morrison, of Glen Robinson.

—The Blind River Boom & Slide Company have been authorized to increase their capital stock to $16,000 and to construct certain improvements to the company's works.

—The estate of the late Robert Hurdman, of Ottawa, is valued at $460,000. A large portion of the estate consists of timber limits purchased from Mr. Klock about four years ago.

—Oliver Laberge has withdrawn from the Springer Lumber Company, Sturgeon Falls, Ont., and the business will be continued under the same name by Mageau, Serre & Company.

—S. O. Church & Bro., whose cooperage stock plant at Sand Point, Ont., was burned about the middle of June, immediately started building operations and now have their hoop mill nearly completed.

—Wm. Pedwell is running a saw mill on Owen Sound Bay, at Brockholm, Ont., about one mile from Owen Sound. He is cutting all kinds of hardwoods and softwoods and finds business compares very favorably with other years.

—J. L. Reaume, of Essex, Ont., has purchased the McIver property at Kearney, and is building a saw mill and stave and heading factory. He is also said to have purchased the timber limits known as the Whiteside limits.

—The St. Catharines Wood & Timber Company has been organized, with head office at St. Catharines, Ont. It is understood that H. J. Nicholls, who has been conducting a lumber and pulp-wood business at Huntsville, has been elected manager.

—By the explosion of a boiler in the saw mill of Peters & Cain, about seven miles from Haliburton, Ont., William Duncan was instantly killed and William Winn was so badly injured that he died within a few hours. The mill was completely demolished.

—The Pigeon River Lumber Company, of Fort William, Ont., are constructing a railway across a fine timber belt in Cook County, extending to Big Bay, on Lake Superior. The timber will be railed to Big Bay and towed from there to the company's mill at Fort William.

—The Kearney Timber & Manufacturing Company, Limited, is the name of a new company just licensed in Ontario to carry on a saw mill business. The company is incorporated under the laws of Great Britain and is composed almost entirely of English capitalists. Walter Gow, of this city, has been appointed attorney for the company. It is understood that operations will be carried on at Kearney, Ont.

—A number of Ottawa Valley lumbermen, including Hiram Robinson, H. K. Egan and A. Blackburn, of Ottawa, and A. Barnet, of Renfrew, have applied to the Ontario Government for permission to build a dam on the height of land north of Lake Temiskaming, in order to obtain sufficient water to carry logs down to Ottawa. It is proposed to raise the water in the tributaries of the Ottawa and Desquinze rivers.

—The Canadian Timber Company, Limited, has just been incorporated at Ottawa, with a capital of $250,000. The charter gives the company all the rights required for the operation of a lumbering and pulp business, as well as power to generate electricity. The incorporators are W. B. McAllister and William Anderson, of Ottawa, J. A. Cameron, of Dominionville, Ont., S. Dowd, of Quyon, Que., the two latter being lumbermen.

—Justice Teetzel has dismissed the action for damages brought by the widow and children of J. S. Valiquette against Fraser & Company, of Ottawa, for the death of Mr. Valiquette. It will be remembered that Valiquette was employed in installing machinery in Fraser & Company's mill at Lake Deschenes, when a windstorm caused the walls to collapse, killing him. His lordship held that the mill owners were not liable, and the contractor who did the brickwork was also freed from responsibility.

—The new planing mill built at Parry Sound, Ont., by George White has now been in operation over a month and is giving good satisfaction. The mill is located on the bank of the Seguin river, the main building being 42 x 65 feet, two stories, with asbestos fireproof roof. The engine room is 22 x 26 feet and contains an engine and boiler each of 30 h.p. capacity. The machinery on the ground floor consists of a matcher, rip-saw, surface planer, hardwood flooring machine, and a cut-off saw. On the upper floor there are a sticker, combination saw table, planer, power mortiser, tenoning machine, band-saw, two turning lathes and a sand paper machine.

THE EASTERN PROVINCES.

—Lacourse & Doucet have registered in the lumber business at Grand Mere, Que.

—A. Ouellet, Ste Angele, Que., is advertising his saw mill and timber limits for sale.

—Fletcher & Ross have recently improved their steam saw mill at Cherry River, Que.

—The Compagnie La Drolet has obtained a charter to manufacture lumber at St. Germaine de Granthan, Que.

—A Heon & Company have registered a partnership as sash and door manufacturers at Shawinigan Falls, Que.

—The sash and door factory of L. P. Morin & Fils, St. Hyacinthe, Que., was partially destroyed by fire last month.

—Phillippe Lambert, jr., has registered as proprietor of the business of P. Lambert & Cie, sash and door factory, St. Cyrille de Wendover, Que.

—The new saw mill of the Davidson Lumber Company at Bridgewater, N. S., has commenced operations. It is equipped with modern machinery and is capable o a daily cut of 65,000, feet.

—For some time B. A. Scott, of Roberval, Que., noticed that a number of his logs were disappearing. He set about to discover the thieves and was successful, with the result that several residents of the locality will appear before the magistrate.

—The Davison Lumber Company, of Bridgewater, N. S., purpose building a railway through their timber limits. The road will be about 25 miles long and will connect with the Halifax & South-Western Railway. The object of the road is to do away entirely with the driving of logs. They will also build a large steam mill.

—At a recent meeting of the creditors of R. A. Estey, held at Fredericton, N.B., it is understood that the ordinary creditors opposed a preference being allowed John E. Moore and George McKean, whose claims aggregate about $70,000. Should all the creditors be paid on an equal footing, the estate will pay at least sixty cents on the dollar.

MANITOBA AND THE TERRITORIES.

—Anderson Bros. have opened a lumber yard at Bowden, N.W.T.

—The Gibson Lumber Company have opened a lumber yard at Lemberg, N.W.T.

—The dissolution is announced of May Bros., planing mill proprietors, Saskatoon, N. W. T.

CRAIG MINE CRYSTAL CORUNDUM WHEELS

Our Pure Crystal Corundum Saw Gummers have no equal for their rapid, cool, cutting properties.

Read the following from Bulletin 180 of the United States Geological Survey, which says:

"Often a distinction is made between emery and corundum, many persons not recognizing emery as a variety of corundum.

Emery is a mechanical admixture of corundum and magnetite or hematite. It is, of course, the presence of corundum in the emery that gives to it its abrasive qualities and makes it of commercial value, and the abrasive efficiency of emeries varies according to the percentage of corundum they contain."

Emery is imported, mined by Greeks and Turks and contains only about 25% corundum. Our Crystal Corundum is guaranteed to be 98% pure alumina, a Canadian product, mined and manufactured by Canadians for Canadians.

HART CORUNDUM WHEEL COMPANY, Limited, Hamilton, Ont., Can.

—The Olds Lumber & Hardware Company, Olds, N. W. T., have sold out to A. E. Clemens.

—James Rutledge, of the Gibson Lumber Company, has opened a lumber yard at Melfort, N.W.T.

—The capital stock of the Red Deer Lumber Company, Red Deer, N.W.T., has been increased from $500,000 to $800,000.

—Gaudin, DeWit & Company, lumber dealers, Medora, N. W. T., have been succeeded by the Imperial Elevator Company.

—The Cusson Lumber Company's new sash and door factory in Winnipeg commenced operations last month. It is a verry complete plant, lighted by electricity.

—The Czerwinski Box Company, Limited, has been incorporated in Winnipeg to take over the box business of C. F. Czerwinski. The capital stock is $100,000.

—T.A. Burrows has now in operation at Grand View, Man., one of the largest and most complete saw mills in the province. It is lighted by electricity and gives employment to one hundred men.

—A company has just been organized in British Columbia and the Territories to combat the sale of American lumber in the Canadian market. Capital has been raised to the extent of $400,000 and retail houses will be opened immediately in the Territories and Manitoba.

—A charter has been granted to the Robertson-Adams Lumber Company to carry on a wholesale and retail lumber business and to operate saw and planing mills. The headquarters of the company will be at Crystal City, Man., but operations will also be carried on at the villages of Snowflake, Clearwater and La-Riviere, Man. The capital stock is $100,000 and the promoters include G. F. Roberson and G. E. Adams, lumber merchants, of Crystal City, and K. G. Adams, hardware merchant, of Cavalier, North Dakota.

—The incorporation is announced, under the Manitoba Joint Stock Companies' Act, of the Manufacturers' Lumber Company, Limited, with a capitalization of $1,000,000. The objects of the company are stated to be to manufacture and sell lumber and to conduct wholesale and retail yards in Manitoba and the North-West Territories and in British Columbia. The following are members of the company: D. C. Cameron, Winnipeg; D. E. Sprague, Winnipeg; John Hanbury, Brandon; Moyie Lumber Company, Moyie, B.C.; A. Leitch, Cranbrook, B.C.; East Kootenay Lumber Company, Cranbrook, B.C.; Crow's Nest Pass Lumber Company, Wardner, B.C.; Fernie Lumber Company, Fernie, B.C.; Robinson Mackenzie Lumber Company, Cranbrook, B.C.; Standard Lumber Company, Cranbrook, B.C.; The Kootenay River Lumber Company, Nelson, B.C.; The King Mercantile Company, Cranbrook, B.C.; Porto Rico Lumber Company, Nelson, B.C.; The Yale Lumber Company, Nakusp, B. C.; Arrowhead Lumber Company, Arrowhead, B. C.; Revelstoke Lumber Company, Revelstoke, B.C.; Canadian Pacific Lumber Company, Port Moody, B.C.; Brunette Saw Mill Company, New Westminster, B.C.; Ladysmith Lumber Company, Ladysmith, B.C.; E. J. Palmer, Chemainus, B.C.; Shawanigan Lake Lumber Company, Victoria, B.C.; Columbia River Lumber Company, Golden, B.C.; W.C. Wells, Palliser, B. C.; R. A. Mather, Keewatin, Ont.; and W. C. Cowan & Company, of Prince Albert, Saskatchewan, N.W.T.

BRITISH COLUMBIA.

—The North Star Lumber Company, of Cranbrook, B.C., are building an up-to-date planing mill as an addition to their present plant.

—The Fernie Lumber Company, Fernie, B.C., purpose building a logging railway to their limits, four miles distant, at a cost of $2,000.

—The Elk Lumber & Manufacturing Company intend building a saw mill at Hosmer, B. C. This will be operated in addition to their Fernie plant.

—Andrew Haslam has made rapid progress with the rebuilding of his mill at Nanaimo, B.C., and is now in a position to supply the requirements of his customers.

—John Haggarty & Company, Limited, has been incorporated at Victoria, B.C., with a capital of $10,000, to carry on the business of loggers, teamsters and contractors.

—We understand that J. A. Sayward, of Victoria, B. C., purposes installing this fall a band saw mill of 100,000 feet daily capacity and catering to the North-West trade.

—John Taylor, formerly of the Taylor Mill Company, Victoria, B.C., has purchased a water front lot on the harbor of that place and intends building a saw mill in the near future.

—The Standard Lumber Company, of Mayook, B.C., purpose erecting a new saw mill in the fall, with a capacity of 50,000 feet per day, at Fort Steele Junction, on the Crows Nest Road.

—James Muirhead, of the Victoria Planing Mills, Victoria, B. C., purposes making a large addition to his wharf and installing additional plant in his mill. Mr. Muirhead is one of the pioneer mill owners of Victoria.

—The new saw mill of the Canadian Timber & Saw Mills, Limited, at Trout Lake, B. C., was put in successful operation last month. A 6-car barge has been built for the company to transport the lumber direct from Trout Lake City to Gerrard.

—The Kamloops Lumber Company, Limited, last month purchased the mill and timber limits of the Okanagan Lumber Company. It is said to be the intention of the company to make Enderby their headquarters and to further enlarge their mill at that place.

—A bush fire raging at Serge Narrows, B.C., drove the men of J. A. Bull's logging camp to the water, where they took refuge from the fierce flames on board hastily-constructed rafts. The fire had been burning for some days, but was not dangerous until a change in the wind occurred.

—The Crows Nest Pass Lumber Company, of Wardner, B. C., purpose erecting a shingle mill with a capacity of 150,000 a day, and a sash and door factory to work up their high grade material. With this end in view they have just purchased 3,000 acres of high class cedar limits to supply the shingle mill.

—It is again reported that the Ross-Maclaren saw mill at New Westminster, B.C., which a short time ago passed into control of W. L. David, of Blaine, Wash., and other United States capitalists, is to resume operations in the near future. Mr. David has asked certain concessions from the city of New Westminster and from the Government, the principal of which is the enlarging of the channel in the Fraser river to admit large sailing vessels.

—The sympathy of the lumber trade is extended to the members of the Canadian Pacific Lumber Company, whose mill at Port Moody, B. C., was almost totally destroyed by fire last month, entailing a loss of $80,000. The officers of the company are: President, T.W. Patterson; secretary, T. F. Patterson; manager, Perry E. Roe; superintendent, R. Abernethy. The mill was built eleven years ago by John Murray, now timber inspector, and cost in the neighborhood of $60,000, but additions have been made since. The company have decided to rebuild.

PERSONAL.

The death of Mr. Charles F. Baker, secretary of Randolph & Baker, Limited, Randolph, N. B., took place about the end of June.

Mr. George Reid, father of Mr. J. B. Reid, lumber merchant, Toronto, died at Toronto Junction on July 13th, in his seventy-seventh year.

It is rumored that Mr. Hiram Robinson, of the Hawkesbury Lumber Company, will be the Conservative candidate in Prescott County in the coming Dominion election.

At the annual meeting of the Nova Scotia branch of the Canadian Manufacturers' Association, held in Halifax last month, Mr. Alfred Dickie, lumber manufacturer, Lower Stewiacke, N. S., was elected president for the ensuing year.

The lumber trade has learned with gratification of an improvement in the health of Mr. John Charlton, M.P., of Lynedoch, Ont. Mr. Charlton will again resume his parliamentary duties but has been advised by his physician to take a continental trip before doing so.

Mr. James Lightbody, who has been in Canada for about three months in the interests of his firm, F. A. Lightbody & Company. timber merchants, Glasgow, Scotland, sailed for home about the middle of July. Mr. Lightbody has made many friends in Canada both in business and socially.

According to figures published in the Stastistical Year Book of Canada, there were exported to the United States in the year 1903 wood pulp to the value of $1,795,768. This compared with $1,170,400 in 1902, $937.330 in 1901, $1,193,753 in 1900, and exports below $600,000 for the previous ten years. The pulp wood exported from Canada in 1903 was valued at $1,558,560, as compared with $1,194,593 in 1902, $1,364,821 in 1901, an $864,077 in 1900. The average value of the pulp wood exported was $4 per cord.

THE HANCHETT ADJUSTABLE SAW SWAGE

For all Sizes and Kinds of SAWS—CIRCULARS, GANG, CYLINDERS, BAND RESAW and BAND SAWS.

BECAUSE The Hanchett Swage is the Best Swage
It Saves the Saw Blade, Files, Time and Labor

By the action of the dies the teeth are drawn out, which not alone refines the steel, causing the saw to hold a better cutting edge, and prevents crumbling and splitting of teeth, but at the same time increases life of saw from 20 to 30 per cent.

The Adjustments are perfect, and are quickly and easily made.

Hanchett Swage Works, Big Rapids, Mich, U. S. A.

FOR THE CAMP—

We have a very suitable lot of goods for camp supplies. We make this kind of trade a specialty. You who are not getting suited just as well as you would like, try us for your next order, and give us a chance to demonstrate our ability to give you satisfaction in this very important department of your business.

H. P. ECKARDT & CO.

Wholesale Grocers TORONTO

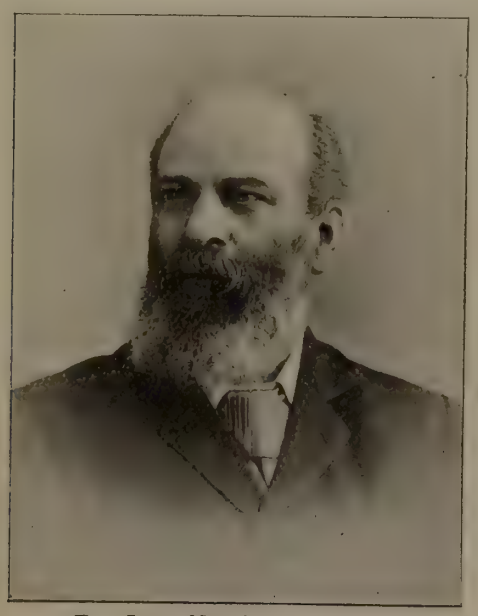
NEW LOCATION.

The wholesale hardwood firm of McBean & Verrall are now located in their new office built by themselves at the foot of Bathurst street, Toronto. The building is of substantial construction, finished in quarter-cut oak, with hardwood floors, hot water heating and other modern equipment, and the location and accommodation provided are such as to enable them to handle their growing business most conveniently. In their yard, adjacent to the office, they have in stock upwards of one million feet of hardwoods in all thicknesses, including mahogany, cherry, oak, chestnut, maple, birch and ash. They make a specialty of rock elm and hard maple, and on account of the large stock carried, they are always in a position to supply lumber thoroughly seasoned. Mr. John A. McBean gives his sole attention to the purchase of stock, while the selling end of the business is looked after by Mr. Fred T. Verrall.

OBITUARY.

MR. ALFRED CROSS.

The death occurred in Liverpool, England, recently, of Mr. Alfred Cross, for many years identified with the business of Joseph Owen & Sons, Limited, timber mer-



THE LATE MR. ALFRED CROSS.

chants, Liverpool, who are large importers of Canadian lumber. Mr. Cross was sixty-one years of age. When a young man he became identified with the timber and building trades, and in 1866 was engaged by the late Mr. Joseph Owen as manager of his new saw mills in Liverpool. New mills were erected and the volume of the business of the firm increased twelve-fold during the time of Mr. Cross' connection with it.

The business was converted into a limited company a few years ago, when Mr. Cross was appointed a director, and continued as manager of the Liverpool mills.

Few men have acquired so thorough a knowledge of the timber trade as Mr. Cross possessed. He was a competent judge of all kinds of timber, native and foreign, understood all processes of manufacture and was a good buyer and a clever salesman.

Mr. Cross visited Canada, the United States and the West Indies on business for his firm. He enjoyed the friendship and esteem of a large circle of friends both in society and business, and his demise is deeply regretted.

MR. F. BILLINGSLEY.

The late Frederick Billingsley, of Quebec, was well known in lumber circles throughout the greater part of Eastern Canada as well as in Great Britain. Born in

THE LATE MR. F. BILLINGSLEY.

1841, he entered the office of Messrs. H. & E. Burstall at the age of thirteen, and died a partner in J. Burstall & Company at the age of 63—an unsevered connection of over fifty years.

An astute, earnest business man, he was as much esteemed in commercial circles as in his private life. He was at the time of his death a director of the Quebec Bank, President of the Quebec Warehouse Company and a Past-President of the St. George's Society.

The large attendance at his funeral, irrespective of race and creed, was a testimonial to his worth.

MR. A. B. LEE.

Mr. Arthur Burdett Lee, president of Rice Lewis & Son, Limited, wholesale hardware merchants, Toronto, died on June 22nd, aged sixty-six years. He entered the employ of Rice Lewis and Son in 1856, and in 1889 became president of the company. He took an active interest in public affairs, being for over twenty years Chairman of the Board of Harbor Commissioners, and at one time holding the position of President of the Board of Trade.

Mr. John A. McBean, of the hardwood lumber firm of McBean & Verrall, Toronto, has been in England for the past three months on business and pleasure combined. He expects to return home about the end of August.

Lumber firms who intend sending men into the woods during the coming fall and winter will be interested in the announcement of the Capstan Manufacturing Company appearing in the advertisement pages of this issue. This company make a specialty of provisioning lumber camps.

TRADE NOTES.

The British Columbia Marine Railway Company are announced to have acquired by lease the plant of the Albion Iron Works at Victoria, B.C.

The Ashland Emery & Corundum Company, incorporated under the laws of the State of New Jersey, has been authorized to carry on business in Ontario.

John W. Hennigar, whose saw mill at Noel, N.S., was destroyed by fire recently, is rebuilding, and has ordered a new mill from the Oxford Foundry & Machine Company, of Oxford, N.S.

The annual picnic of the employees of the Dodge Manufacturing Company, Toronto, was held at Bond Lake on Saturday, July 9, when an interesting programme of sports and music was enjoyed.

The Hanchett Swage Works, Big Rapids, Mich., have recently placed upon the market a swage shaper which is said to be remarkable for its simplicity of construction, perfect adjustment, great speed of operation, and the excellent work which it is capable of doing.

Your boilers are the source of your power. They determine in a very large measure your output and your profits. If they do not generate sufficient steam, your machines lag, you are compelled to shut down occasionally, your men stand idle, your output suffers and your profits rapidly dwindle. Your mill is productive only when in operation. Many of your expenses continue all the time, whether your mill is running or idle. Not so your profits. They increase only when your mill is running, and stop when your mill shuts down, whether for a season, for the night, or only for an hour. Not only do your profits come to a standstill when you are compelled to shut down for say half an hour to wait for steam to rise, but your expenses are at their maximum, as, in addition to your fixed expenses, such as taxes, insurance, depreciation, salaries, etc., every man on your pay roll is drawing full pay. For this reason, shutting down to wait for steam to rise is very expensive, your profits coming to a standstill, and your expenses remaining at their maximum. Those so situated would do well to install the Gordon Hollow Blast Grate, which insures a full head of steam regardless of the weather. In addition, it permits wet, green or frozen sawdust and other refractory refuse to be used as fuel, giving as good results with them as a draft grate gives with dry wood. Those interested should write the Gordon Hollow Blast Grate Company, Greenville, Michigan, for their Catalogue D.

Corrugated Iron

For Sidings, Roofings, Ceilings, Etc.

Absolutely free from defects—made from very finest sheets.
Each sheet is accurately squared, and the corrugations pressed one at a time—not rolled—giving an exact fit without waste.

USE YOUR SAWDUST.

The accumulation of sawdust and other refuse around a mill is a prolific source of fires. It must inevitably increase the rate of insurance. The latter is also true of the so-called "hell-hole," fed by a conveyor. Again, the sawdust heap is so unsightly, and takes up room, while its formation represents considerable labor, on the part of men and teams. It often happens that, while the refuse is being carried to the dump heap, saleable wood is being used to fire the boilers.

Now, it seems a self-evident proposition that in a case of this kind a grate that would consume the sawdust under the boilers, and save the aforesaid wood, permitting it to be sold, would be an excellent investment. It would save the expense of hauling the sawdust away, reduce the risk of fire, probably reduce the insurance rate, and render it possible to sell, often at a good figure, the wood that is now being used to run the mill.

We suggest that those interested in this subject take the matter up with the Gordon Hollow Blast Grate Company, of Greenville, Michigan, manufacturers of the celebrated Gordon Hollow Blast Grate, which runs a mill with its sawdust and other refuse, even though wet, green or frozen. The grate is sold on approval, thirty days being given in which to thoroughly test it.

THE DISTINGUISHING MARK

ATKINS ALWAYS AHEAD. ★ E.C. ATKINS & CO. INDIANAPOLIS, IND. ★ AAA TRADE MARK

To install in your mill a set of saws that will suit you in every particular, it is necessary that you be familiar with some means of distinguishing the HIGH-CLASS SAWS from the others. Knowing some such mark you wil always discriminate in favor of the saw which bears that mark of QUALITY.

THE ATKINS "TRIPLE A" etched on all HIGH GRADE SILVER STEEL CIRCULAR and BAND SAWS, is the sign which assures QUALITY, EXCELLENCY and absolute SUPERIORITY in Saws. "IF IT'S SILVER STEEL IT'S AN ATKINS." Look for our trade mark.

A little reminder of the "TRIPLE A" in the way of a pretty watch charm to Mill men who write for it. Also our Mill Supply Catalogue. Both free.

PATENT FOR CENTERING LOGS.

W. H. Welbon is the inventor of an improved means for centering logs, which has been assigned to the Hastings Shingle Manufacturing Company of Vancouver, and on which a Canadian patent has just been received. The invention consists of a means for supporting a log at the ends of its longitudinal axis in such a manner as to allow it to rotate freely as required in the radial board-cutting system, which has been introduced in Messrs. McNair Bros.' No. 2 mill, and which is the subject of further patents. Where cedar logs of larger diameter are used, which are the ones best adapted for this system of radial board cutting, and which are generally hollow or decayed toward the heart, it becomes necessary to provide an axial support while the log is being operated upon, and the device which is the subject of this patent consists of a means of forming a series of annular grooves in the end of the log, and a metal plate having corresponding projecting rings and a centre support.—British Columbia Lumberman.

Not Like a Hollow Log

The tins that holds **Clark's Corned Beef** are chock full of prime Canadian beef properly prepared. Look for the name of **Wm. Clark, Montreal,** and get flavor as well as quantity.

The A. J. Burton Saw Co., Limited, Vancouver, B.C.

INCORPORATED 1904

AUTHORIZED CAPITAL, $75,000, IN 750 SHARES OF $100 EACH

A. J. BURTON, Managing Director.
HERBERT WILKINSON, Secretary-Treasurer.

BOARD OF DIRECTORS: ROBERT JARDINE, President; DR. E. SAWYER, Vice-President; E. W. McLEAN, HENRY PIM, A. J. BURTON.

BANKERS, Molsons Bank, Vancouver, B.C.: OFFICE AND WORKS, Corner of Powell Street and McLean Drive, Vancouver, B.C.

The company is offering stock to the public at par.

The company has purchased land, consisting of four lots, upon the corner of McLean Drive and Powell Street, Vancouver, B.C., facing Powell Street, and running back to the C.P.R. track, and with one side upon McLean Drive, (now opened up). The whole measuring 185 ft. by 132 ft.

Upon this a building has been erected, 85 ft. by 40 ft., two floors, with a tempering shop 26 ft. by 32 ft. one floor at one side.

A 50 h.p. motor and the main shafting and pulleys are already installed. A portion of the machinery has been ordered, including a milling machine for the inserted-teeth saws, a heavy parallel grinder for band saws, and the material for the tempering furnace.

The company is having its circular saw grinding machine built after the latest improved American model.

The stock already sold is more than sufficient to cover the cost of the land, buildings and the machinery and supplies now in hand and ordered.

Further stock is now offered for purchasing the further necessary plant and supplies, to complete the whole, and enable the company to execute the orders which are already promised to the company.

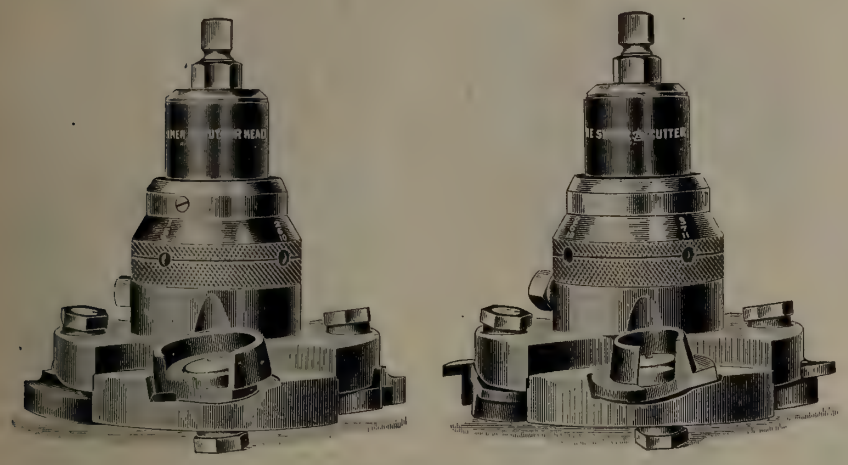
The inquiries already received from users of the company's manufactures ensures that the works will be fully occupied in executing orders, and sufficient land is owned by the company for extending the works when the needs demand it.

The company enjoys the advantages of cheaper fuel for the tempering furnaces, and oil for hardening, than can be obtained in Eastern Canada, and Messrs. Jessop, of Sheffield, have quoted the company the same prices for their steel delivered at Vancouver as at Toronto.

Applications for shares will be received by the Secretary, HERBERT WILKINSON at the company's offices, corner Powell Street and McLean Drive, Vancouver, British Columbia.

The Shimer Cutter Heads

WITH EXPANSION

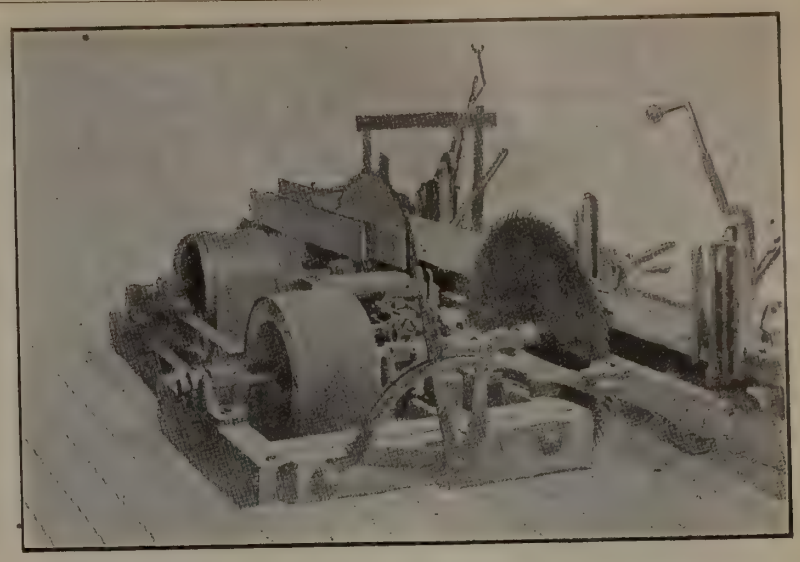


Are built from forgings of Steel and finished throughout in the solid metal. This insures accuracy, durability and perfect mechanical adjustments.

They are appreciated by the user because they hold up under the severest tests. They cut easily all kinds of hard, knotty and cross-grained lumber. If you make single tongue and groove Flooring, Ceiling and Wainscoting, buy THE SHIMER CUTTER HEADS and you will have no disappcintment. Address

SAMUEL J. SHIMER & SONS

Milton, Pennsylvania



"KILLAM'S TANDEM CIRCULAR SAW MILL"

The attention of Manufacturers of Lumber is called to the above named latest and best method of sawing lumber.

The following advantages are obtained:

Lower cost of installation than any other method which will saw an equal number of superficial feet in a given length of time.

Smaller expense in operation, thus producing lumber at a lower cost per thousand feet than any other method.

Requires no more help to operate it than any well equipped Circular Saw Mill.

Lumber has been sawn better and more accurately cut by this method than by any other now in use.

The Killam Tandem Circular Mill requires no more skilled men to operate it than is required to operate the ordinary Circular Mill.

If solid saws are used, the larger one, when worn down can be used for the smaller one, thus saving expense for saws.

No difficulties in handling or setting by this machine and no delays.

No time is lost in setting for any thickness from the cut of stationary saw up to six inches.

This machine takes the place of a resaw in a mill and only requires a floor space of 6 ft. x 6 ft.

Also takes the place of a Twin Circular Mill that is now used for slabbing, and this machine will side as much lumber as any Twin Circular, thus saving the expense of a resaw and men to operate the same.

This machine is so cheap that any manufacturer of lumber can well afford to have one, for it will pay for itself in a short time.

Will cut 50 per cent. more lumber than the Circular Mills now in use.

MANUFACTURED BY OXFORD FOUNDRY & MACHINE COMPANY, OXFORD, N. S.

REFERENCE.

M. L. KILLAM, Truro, N. S.

Dear Sir,—It gives us great pleasure to testify to the value of your Tandem Circular Saw Mill. It has paid for itself twice over during the six months we have run it. It requires no more help to operate it and the lumber is more evenly sawn. It does all that you claim it will and we would recommend it to any manufacturer who wishes to make more and better lumber with the same help as with the Single Circular Mill. Wishing you success, we are Yours very truly,

Dec. 31, 1903. DICKIE & McGRATH, Tusket, N. S.

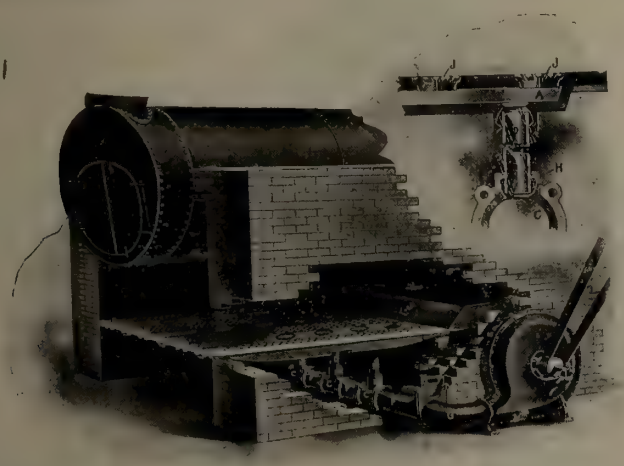
THE GORDON HOLLOW BLAST GRATE

It makes two boilers do the work of three.

It runs a mill with wet, green or frozen sawdust or other refuse.

It outlasts from three to five sets of draft grates.

Its durability is such that in the end it is the cheapest grate made, in addition to which it frequently pays for itself every thirty days by reason of its wonderful efficiency in promoting combustion.



It is sold on approval, thirty days being given in which to thoroughly test it. If unsatisfactory, it may be returned at our expense.

The blacksmith could not get along without his forge, nor could the founder melt his iron without a blast. In like manner, the user of the Gordon Hollow Blast Grate soon finds it indispensable. It has helped others; why not you?

In writing for prices, give number of boilers, width of furnaces or ovens and length of grates.

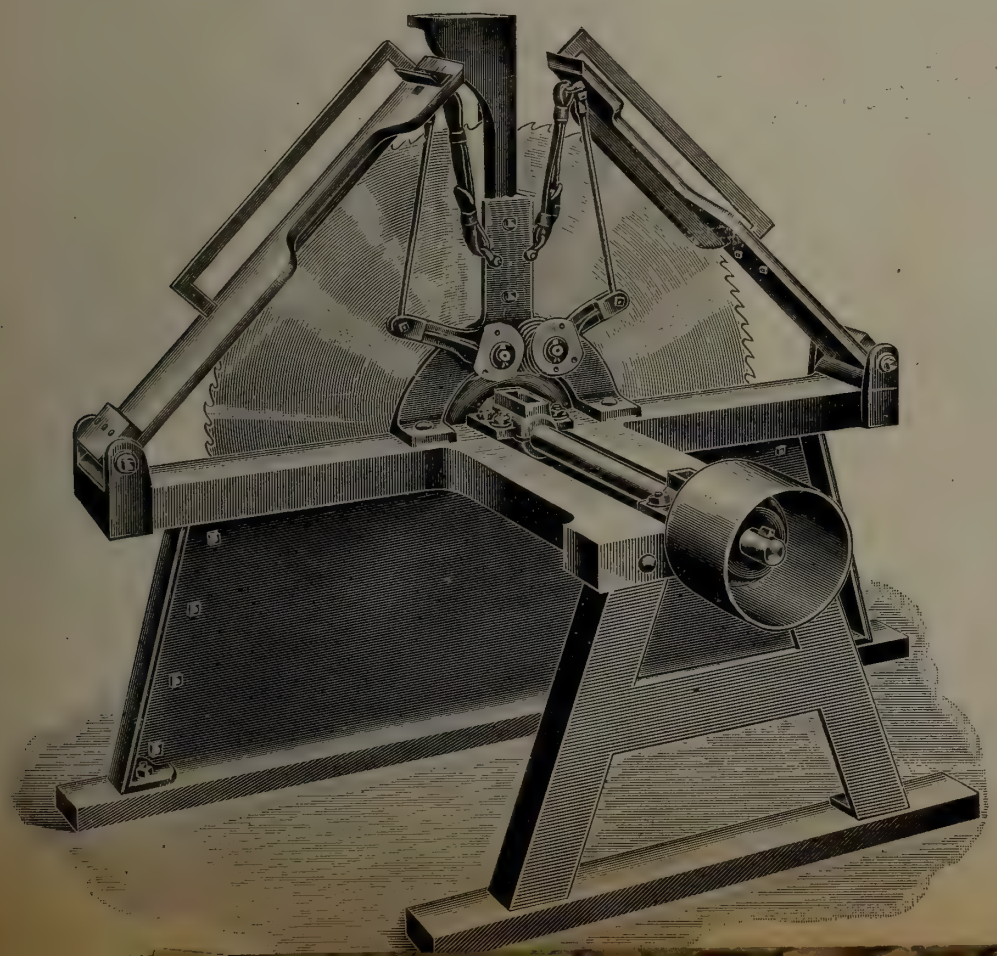
Clark & Demill
Galt, Ont.

THE "CANADIAN" SHINGLE AND HEADING EDGER



Has solid iron frame. Made for two operators. Drive pulley, unless otherwise ordered, is 8 inch diameter for 6 inch belt. Heavy steel saw arbor with extra long bearings. The saw is 40 inches in diameter, 16 gauge, 100 teeth, and should run 1,600 revolutions per minute. The saw can be easily removed for filing when necessary.

The Spring Boards are fitted with guards to protect the operator from the saw. The springs can be easily adjusted for any desired tension.

This machine is a "timber saver" and will make more No. 1 Shingles from same quantity of timber than any wheel jointer in existence. Mill men who have once used it will not have any other.

For capacity, removing sap-wood, rot, knots, or other imperfections, or making parallel shingles, and economy of stock, it has no equal.

Send for Catalogues of Saw and Shingle Mill Machinery.

NATURAL DRAFT
MOIST AIR . . **DRY KILNS**

LUMBER TRUCKS and
TRANSFER CARS

Write for prices and particulars of the most simple and efficient Natural Draft Dryer on the market. Testimonials and list of users sent on application. Every square inch of heating surface is utilized to the uttermost and perfect ventilation and circulation is obtained by a very simple arrangement of ducts. Write for particulars to

SHELDON & SHELDON,
GALT, ONT.
FORMERLY McEACHREN HEATING & VENTILATING CO.

Easy-Running, Everlasting
DRY KILN TRUCKS

Built to endure for a lifetime—and to render satisfactory service every day you use them.

Wheels of unbreakable **malleable** iron.

Steel roller bearings with **cone-shape** ends that substantially reduce the friction caused by the old-style flat end bearings.

Axles with **milled** ends that hold them stationary without riveting. If necessary, you can take

The Standard
Channel Steel, Roller Bearing
Dry Kiln Truck

all to pieces without injuring any of its parts—which you can't do with a truck that has riveted axles.

Made in all styles and sizes. Our Catalogue "D" describes and illustrates them. Pleased to send you a copy on request.

THE STANDARD DRY KILN CO.
Indianapolis, Ind.

THE TRIUMPH TURBINE

Is the most powerful wheel on the market to-day. A glance at this cut of the centre shows that the buckets are designed to secure the **maximum** of **speed** with **great power** and a **free discharge.** Mr. E. S. Edmondson, of Oshawa, writes as follows under date of November 16th, 1903, regarding a 26 inch Vertical Triumph Wheel:

> "The Wheel is strictly first-class in every particular, and after a careful and thorough test I am prepared to say that I believe it is the best wheel in the market for Electrical purposes. It has high speed, large power, high efficiency at part gate, and has practically no leakage. I am more than pleased with the thorough and workmanlike setting you gave me throughout."

For horizontal settings in large Pulp Mills, Cement Mills or Electric Power Developments this Wheel has no equal. We invite your enquiries. Large catalogue to be had for the asking.

We are always glad to submit estimates and prices on **Improved Vulcan and Leffel Turbines, Improved Lane Circular Saw Mills, Edgers, Trimmers, Slashers, Shingle Machines, Lath Machines** and all machinery of this kind.

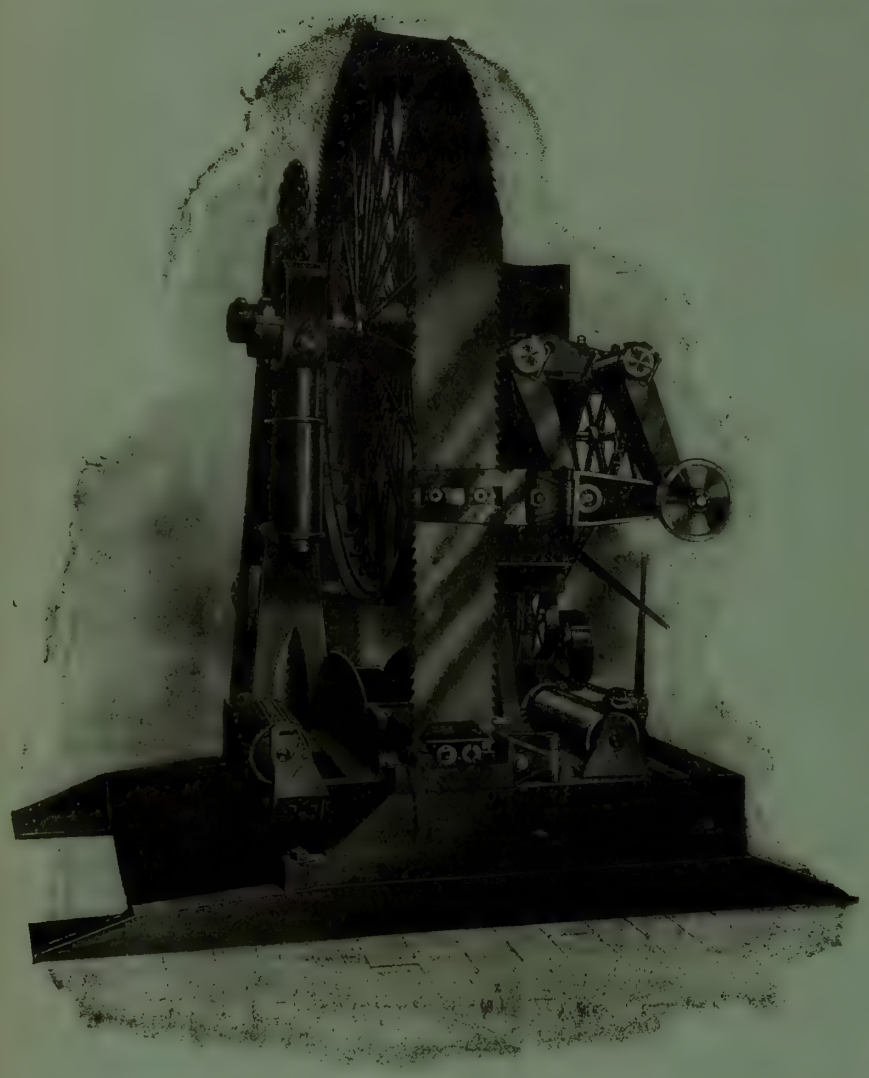
The Wm. Hamilton Mfg. Co., Limited

Builders of a Complete Line of

SAW MILL MACHINERY



This cut illustrates our Double Cutting

Weight Tension Band Mill

It shows the same good quality of workmanship that has made our machinery the standard for saw mills.

The top wheel is supported from above and guided below, which does away with all vibration of the wheel. Besides, sawdust cannot in any way interfere with the action of the adjusting and tension devices.

Saws can be changed on this mill quicker than on any other weight tension mill.

Send for our catalogue giving full information.

Along with this Band Mill, every saw-mill should have our

Improved Steam Setting Machine

It sets up to 4 inches, besides saw kerf, with one throw of the lever.

By its use, your daily cut can be increased easily 3000 feet, and the quality of the lumber greatly improved.

May we not send you a copy of our new catalogue illustrating this machine ?

If you require anything for a saw-mill, write us—You should use our machinery.

Save Time **Save Files**

This Saw Stands Without a Rival

AND IS THE

FASTEST CUTTING SAW IN THE WORLD!

Its Superiority consists in its Excellent Temper. It is made of "Razor Steel," which is the finest ever used in the manufacture of Saws. We have the sole control of this steel. It is tempered by our secret process, which process gives a keener cutting edge and a toughness to the steel which no other process can approach.

Maple Leaf Saw Set

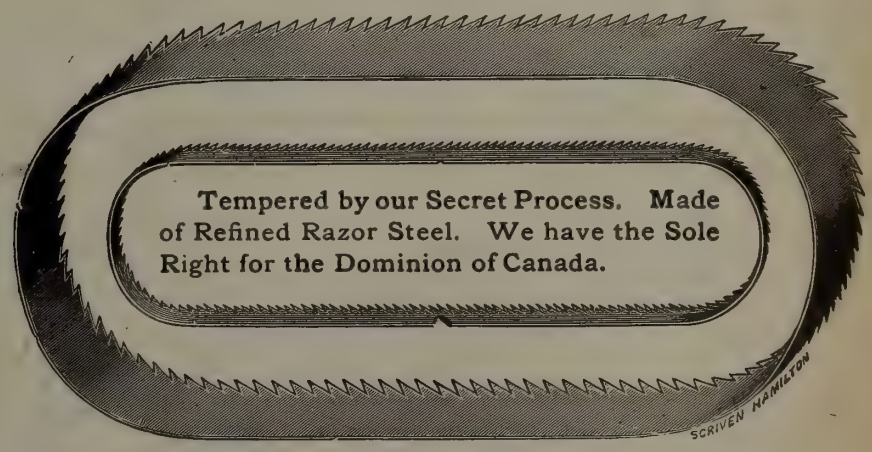
MANUFACTURED BY

SHURLY & DIETRICH, Galt, Ont.

Directions.—Place the set on the point of tooth, as shown in the accompanying cut, and strike a very light blow with a tack hammer. If you require more set, file the tooth with more bevel.

If you follow directions you cannot make a mistake. Be sure and not strike too hard a blow, and it will set the hardest saw. **On receipt of 40 cents we will send one by mail.**

We are the only manufacturers in the world who export Saws in large quantities to the United States.



We Manufacture

HIGH GRADE BAND SAWS

Of All Widths and Lengths.

These Saws are made of Refined Swedish Steel imported direct, and tempered by our Secret Process; for Fine Finish and Temper are not excelled.

MADE IN CANADA

FAIRBANKS WOOD-SPLIT PULLEY

The Best for Saw and Planing Mills

This pulley is not an experiment but has been sold for several years past all over the United States, and the universal satisfaction it gave and the success it met with prompted us to manufacture in Canada.

It has a reputation superior to that of any other Pulley for merit of design, workmanship and finish.

The web construction (see cut), built in the rim, not only strengthens the entire Pulley but makes it impossible for the rim to work loose at the arm.

Each segment is not only glued but nailed with three nails to the next one. Four point bushings are used, giving twice as much grip on the shaft as in the usual two piece bushing.

The merits of any article are best proved by a trial. Send us a trial order the next time you want any pulleys. We carry a large stock and with our factory in Montreal can supply any special pulley in 24 hours if not in stock.

WANTED

SITUATION WITH LUMBER COMPANY, as chief clerk or bookkeeper of woods operations, by an all-round man, Ontario Culler, good stock keeper, temperate and not afraid to work. Address Box 160 CANADA LUMBERMAN, Toronto.

FOR SALE

Large Tract of Timber

In Central Ontario

THE PROPERTY OF

THE CANADIAN LAND AND IMMIGRATION CO., OF HALIBURTON (LIMITED).

This company has a large tract of well timbered land about 125 miles northeast of Toronto. There are large quantities of Cedar, Hemlock, Spruce, Balsam, Basswood, Cherry, Birch, Maple, also considerable Pine, Elm and Ash on this tract. It is well served by two railroads. The Company are prepared to sell this timber in blocks ranging from 5,000 to 10,000 acres, or more if desired.

There are several good mill sites on the property. This would be a good opportunity for parties who are at present cut out and looking for a new location.

Maps and plans and further particulars can be had by applying to

W. H. LOCKHART GORDON,
Managing Director,
157 Bay Street, Toronto.

FOR SALE — 42 ACRES HEAVILY TIMBERED; Elm, Ash, Blue Oak and Basswood. C. C. HUYCKE, Hastings, Ont.

WANTED — POSITION AS BOOKKEEPER or general office man by young man experienced in woods and manufacturing departments; has knowledge of stenography, also knows the mechanical work. Address with particulars, Box 164, CANANDA LUMBERMAN.

POSITION WANTED.

BY A THOROUGHLY COMPETENT LUMBER Inspector, Log Scaler, and general office man. Seven years' experience with large lumbering and lumber manufacturing concern. None but employers reply. Write first to Box 163, CANADA LUMBERMAN, Toronto, Ont.

$75,000

will buy a Timber Limit under the old license regulation, well located. Estimated twenty million of Pine, sixteen million feet of other kinds of timber, and at least twenty five thousand cords of pulp wood. For terms of particulars apply to Box 154, CANADA LUMBERMAN, Toronto.

WANTED

CASH PRICES ON SPRUCE AND HEMLOCK yard sizes, delivered by boat and in car lots to New York points.

SOUTHERN PINE COMPANY,
Rooms 1014 & 1015, 42 Broadway,
New York City, N.Y.

TIMBER LIMIT FOR SALE

BERTH NO. 3 SITUATED ON THE SOUTH WEST corner of the township of Creelman comprising lots number 7, 8, 9, 10, 11 and 12 in the first, second and third concessions; good location, Vermillion river running through centre. For terms and particulars apply to W. RYAN, North Bay.

CURRENT TRADE CONDITIONS.

ONTARIO.

The close of the month of August finds conditions not altogether favorable to the lumber market. The building strike in Toronto, which is still unsettled, is having a depressing effect and is certain to cause a perceptible decrease in the consumption of lumber, as the season is now getting too late to commence work on large buildings in the hope of having them completed this year. The country demand does not show much activity, small orders for immediate requirement being the rule. Conservatism is to be noticed through ut the course of trade. Under these conditions prices are not likely to advance, but it may also be said that the indications of weakness are becoming fewer. There is an absence of pessimistic sentiment, for manufacturers recognize that they can control the situation by curtailing the production. One authority estimates the reduction in the Ottawa Valley log cut the coming winter at 25 per cent. The Georgian Bay production will also be curtailed.

Hardwoods for finishing purposes are meeting with a fair demand, but the implement and furniture factories are not buying as much stock as one year ago. It may be that they have been holding off

in the hope of a decline in prices, which has not yet materialized.

QUEBEC AND NEW BRUNSWICK.

Lumber manufacturers in the Eastern Provinces are not anticipating much improvement in market conditions this year. The usual lethargy attendant upon the summer season is in effect, and shipments to the Eastern States have fallen off. Prices of lumber for that market are a little easier. Very few shipments to Great Britain will be made during the balance of the season. The manufacturers in both New Brunswick and Nova Scotia have agreed to hold over their lumber rather than sell it at the prevailing low prices. It is recognized that a curtailment of logging operations would be very beneficial in restoring healthy conditions, and this policy is likely to be adopted by all the larger manufacturers. The St. John River output is likely to be reduced 50,000,000 feet, and a corresponding curtailment is anticipated in other districts.

UNITED STATES.

The white pine trade has been unsettled by sensational reports of damage to the wheat crop by unfavorable weather and by rust, the prediction being made that the combined winter and spring wheat yield would not exceed 500,000,000 bushels. Aside from the injury to wheat, however, the indications are that there will be an abundant harvest, as a very heavy crop of corn is promised, and what is equally as important, high prices are being obtained for nearly all farm products. There is not likely to be much activity in the market until after the presidential election, with the exception, of course, of that which is due to stocking up for fall and winter requirements. Pine lumber prices are about steady, with manufacturers feeling confident that the entire stock will be required. It is claimed that the stocks that will be left in the docks to carry over this year will be so small compared with former years, that the manufacturers will prefer to carry them over until next spring rather than sell at lower prices. Spruce lumber is slightly weaker, some random stock having been sold in the Boston market as low as $16 by the car. Hemlock is strongly held, and hardwoods are showing better tone. Plain sawed oak, ash, elm and birch are good sellers, while basswood is slow. The shingle market is in fairly good shape, prices now being low enough to warrant laying in a winter supply.

GREAT BRITAIN.

The reports that come to hand from Great Britain contain very little on which to base anticipation of an early improvement in the lumber market. The general trade of the country is in an unsatisfactory condition, as shown by the falling off in both imports and exports. Money is also tight, brought about no doubt by the large expenditure for the South African war. Lumber imports from most of the countries have this year been light, but the deficiency has been more than made good by the supplies from Russia, where shippers have been forced to realize on their stocks. The absence of demand for deals for export to South Africa has increased the depression in the lumber trade, broad sizes which in an ordinary year would have been shipped to that country having been forced upon unwilling British buyers. The demand for pine deals is very light and the poorer qualities are most difficult to place. Quebec pine deals, however, are not likely to recede much further, as they are largely in the hands of persons who are financially able to hold them. The spruce market is, if anything, lower than last week. A cargo from Shediac, N.B., is reported to have been sold a fortnight ago at £5 15s per standard c.i.f., which is the lowest point reached this year. At the late auction sales spruce prices showed no improvement, 3×11 inch second and third quality bringing £8 12s 6d and £7 5s respectively for Quebec shipments. Buyers are holding off in the expectation that there will be large consignments in the fall. Should this not prove to be the case, a recovery in prices may be expected.

STOCKS AND PRICES.

The corporation drive of logs on the St. John river has reached the booms at Fredericton, N.B.

Such general improvement has taken place in the lumber trade on the Coast that the Pacific Coast Lumber Manufacturers' Association, at its meeting held July 29, advanced the price $1 on all fir products. This action was the unanimous vote of all the members present. The advance is the first change that has taken place in the association list since Feb. 5, when a new list was adopted.

The Dalhousie Lumber Company, of Dalhousie, N. B., and Hilyard Bros., of St. John, N. B., have agreed to curtail their logging operations the coming winter by fifty per cent.

A sale of standing pine on Indian lands in the Pigeon river, Fon du Lac, Bois Fortes, Mississippi river, Leech lake and Winnibigoshish reservations will take place November 15th next at the land offices at Duluth, Minn. There will be offered 116,000 acres, estimated by the Government to contain 211,000,000 feet of white and norway pine. No bids for white pine will be received at less than $5 a thousand feet, and $4 for norway.

Messrs. S. P. Musson, Son & Company, under date of August 13th, furnish the following report of the Barbadoes lumber market: "There has not been any arrivals during the fortnight and the position of the lumber market remains virtually unchanged, as the consumption at this season is very limited. Small cargoes of both white pine and spruce would probably be worth in the neighborhood of $26 to $19 respectively, while for large lots prices would be lower. The market for shingles remains as last advised, there being no further arrivals to report, and stocks of Long Cedar having been somewhat reduced, fair prices will be obtained for next arrivals. Dimension are very scarce and immediate shipments would do well. Cedar Laying are in full stock and are not worth over $2 to $2.10."

The Department of Interior, Ottawa, will receive tenders up to Wednesday, September 21st, for a license to cut timber on Berth No. 1,170, situated in the district of Saskatchewan, on either side of Turtle Lake, containing 49 square miles, also up to Wednesday, September 28th, for a license to cut timber on Berth No. 1,171, containing an area of 50 square miles, including all the islands in Cormorant, Yawning Stone, White Water, and White Fish Lake, the remainder to be selected in district of Saskatchewan, N.W.T. The Department is also prepared to receive tenders for a license to cut timber on Berth No. 398, in the Province of British Columbia, about two miles west of Fraser River, containing an area of two and one-half square miles.

VOLUME XXIV. NUMBER 9. } TORONTO AND MONTREAL, CANADA, SEPTEMBER, 1904 { TERMS, $1.00 PER YEAR Single Copies, 10 Cents

THE RAINY RIVER LUMBER COMPANY.

The Rainy River Lumber Company, Limited, composed of American capitalists, have recently completed what is doubtless one of the most modern saw and planing mill plants in America. The location is at Rainy River, Ont., a divisional point on the Canadian Northern Railway, 155 miles east of Winnipeg. The construction of the mill was commenced in October, 1903, and finished May 1st last, operations being commenced ten days later.

The main saw mill building, shown on following page, is 220 x 62 feet; the lath and shingle mill 120 x 32 feet; the filing room 46 x 32 feet. The main equipment of the saw mill consists of two large double cutting band mills, one 52-inch gang and two mammoth edgers, each fed by two men.

The saw mill power house is 76 x 54 feet, equipped with one 32 x 48 Corliss engine and a battery of six boilers 72 inches by 18 feet, complete with Dutch ovens and automatic feeders. The smoke stack is 90 inches in diameter and 172 feet high; the refuse burner 32 feet in diameter and 120 feet high. At the rear of the mill there is a timber dock 100 feet long.

The sorting shed is 320 feet long, with accommodation for 162 lumber cars along its sides, and 500 cars are used in the transportation of lumber from the sorting shed to the yard and from the yard to the planing mill. The yard is equipped with a complete trackage system, covering 17.4 track miles. There are two tracks in each piling alley, and one track in the rear of each alley for the purpose of hauling dry lumber to the planing mill.

The planing mill is 140 x 72 feet and is equipped with the following machines: 32 inch double sizer; 30 inch double sizer and surfacer; 5 matchers; 2 moulding machines; one circular rip saw; one circular siding resaw; 54 inch band resaw; one cut-off saw; one timber planer, capable of handling timber 24 inches square.

The power house for the planing mill is 54 x 46 feet, and is equipped with a 20 x 42 Corliss engine and a battery of two boilers 72 inches by 18 feet, with automatic feeds. The smoke stack is 172 feet high, and the burner 22 feet by 120 feet.

The capacity of the saw mill is 500,000 feet in twenty-four hours, and of the planing mill and shipping department 400,000 feet.

The company have a very complete lighting system, the saw mill being lighted by a 50 k.w. direct connected generator driven by a 12 x 12 Ideal engine, and the planing mill by a 30 k.w. belted generator and a 10 x 12 Ideal engine.

Shipping facilities are provided by two spare tracks leading from the main line of the Canadian Northern Railway, one to the timber loading dock and the other to the dry-shed, loading platform and planing mill. A new drying shed 62 x 270 feet is now nearing completion.

The piling ground is of sufficient area to accommodate a vast quantity of lumber and is most conveniently laid out.

The company own a sufficient quantity of standing timber to keep their mill in operation for twenty years. The officers of the company are: President, Thomas H. Shevlin, Minneapolis; vice-president, W. F. Brooks, Minneapolis; secretary, E. L. Carpenter, Minneapolis; assistant secretary, George S. Eddy, Minneapolis; treasurer, George S. Parker, Rainy River, Ont.; managing director, James A. Mathieu, Rainy River, Ont.

VIEWS OF THE RAINY RIVER LUMBER COMPANY'S MILL AND DOCK, RAINY RIVER, ONT.

The saw mill and veneer plant of the Lake Superior Company at Sault Ste. Marie, Ont., are again to resume operations. One thousand men are advertised for to get out saw logs and pulp wood.

FROM TREE TO CAR.

From the tree to the car loaded with lumber is not a very far cry generally, if measured in miles and compared with the distance the car of lumber travels in getting to the consumer, but there is plenty of room between the tree and the car, says the St. Louis Lumberman, to make or mar the success of the mill man, especially when lumber prices get close enough to make the margin of profit small. When that time comes it is a question of who can cover the distance from tree to car at the smallest cost per thousand feet. Did you ever go over the ground carefully, step by step, as it is covered by mill men in every-day practice, and try to figure out where and how a saving in cost could be effected? If you have you have probably noticed that the average mill man puts most of his saving grace, so far as reducing cost is concerned, on some particular step in the process.

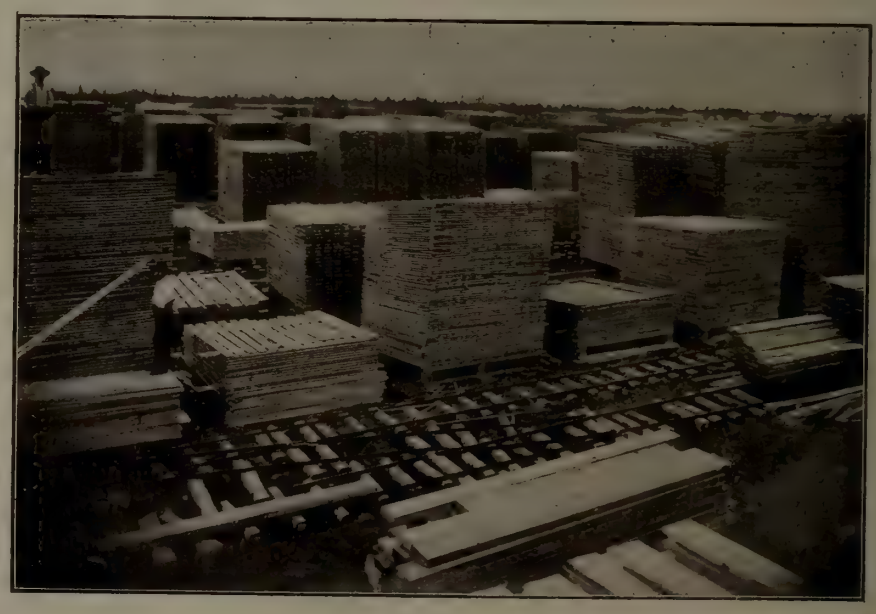
One will make a specialty of good cross-cut saws and good men to use them, and follow it up so thoroughly and persistently that he will reduce the cost of converting a tree into logs to a point far below the average. Another man will give special attention to teams, and the team class of economical mill men is both large and important, some of the most successful mill men having worked out their success almost entirely from being thorough teamsters, pastmasters in the art of keeping up teams and getting the most work out of them. Others take to the railway and mechanical appliances for handling logs, and then there is another, and a large class at that, of mill men who devote by far the larger portion of their economical energy to the manufacturing end, letting nothing pass by that gives promise of reducing the cost of converting logs into lumber. Of course, there are those who combine all of these to an extent, men who look closely

after every step in the process from tree to car, but generally the men who concentrate their attention on some one step in the process make the most rapid strides in that one line. They are specialists in a way, and it is to the specialists in different lines that we naturally look for new ideas, so to get at the ideal all along the line there is probably no better way than to garner ideas from the leading specialists in the different steps and combine them.

VIEW OF MILL AND SORTING SHED, RAINY RIVER LUMBER COMPANY, RAINY RIVER, ONT.

An idea that has had a more or less checkered career in connection with logging operations and still refuses to stay out of the game entirely is the traction engine. A case in point is furnished by A. P. Wylie, a cooperage stock manufacturer of Belle Center, Ohio, who recently bought timber in Tennessee and has equipped a plant down there. He has an 18 horse-power engine that was successfully used up in Ohio for hauling staves to the railroad, pulling a carload of staves at a trip on four wagons. Now he has taken this engine down to his Tennessee plant and proposes to haul logs with it with a confidence of getting good service from it during the summer season, when the roads are comparatively free from mud. And he will likely do just as well as he figures with it, for he knows his business thoroughly in every detail and is well enough acquainted with this engine as a road machine from his past experience with it, to have a pretty well defined idea of what it will do. Then the question is, will the traction engine in its improved state become anything of a factor in southern logging? Its record in the past does not speak so well for it in that territory; it has been used quite extensively and apparently very successfully in the northwest woods, its advent dating back quite a number of years, but its career in the south has been rather checkered—so much so, in fact, as to dampen what early enthusiasm it did create. Several mill men tried expensive experiments with it in one form and another, usually terminating in putting the engine under a shed and using it to drive a small mill or some other machinery. But maybe when it gets its second wind and we go at it with a wider knowledge and better engines the outcome will be different, and maybe it wont. It looks like the modern idea in this line should turn to something in the form of an automobile log wagon instead of a heavy engine that is quite a load in itself. It would at least be interesting to know if any experiments have been tried along this line, for from a theoretical standpoint it looks like there are some possibilities in it, and maybe if we get started to talking and thinking about it something will be developed.

The railroad for transportation and the mechanical log loader make the best combination to be had where the timber belt is sufficiently heavy to justify the outlay, and it is only a question of modern ideas and appliances in carrying out the details of the work under such conditions, but there are other conditions, and there comes the rub. We have come to the point where available heavy belts of timber are not so plentiful and must now turn quite extensively to the small tracts scattered here and there that do not justify railroad building.



LUMBER YARD OF THE RAINY RIVER LUMBER COMPANY, RAINY RIVER, ONT.

With timber of this class it becomes a question of small mills and the hauling of rough lumber or the larger and more modern mill plants with some improved method of logging, and it will unquestionably be more satisfactory if a method of logging can be developed that will permit the latter. If it can not be done the saw mill men might take up the plan of the oak stave men of having a finishing plant at some central point and portable mills to move here and there for cutting rough stock for concentration at the planing mill or finishing plant. Some mill men have followed this plan more or less in the past, but we are coming to a point where we will be confronted with this scattered timber problem so generally it is not a matter of mere incident here and there; it is a big problem, covering a wide field, and the question is, which direction shall we take in the effort to solve it; shall we turn to the portable mill or seek improvements in logging methods? If it is logging methods it means mechanics in some form or other.

To leave the log road for a while and get into the mill, there is a seasonable topic for discussion in the matter of house cleaning, the use of those twin implements of cleanliness and safety, the broom and the whitewash brush. Their value as an asset may not show up in figures on your books, but they do not draw heavily on the expense account, and they actually give more returns for the time and money expended than any other appliances about the place. The ghost of spontaneous combustion that begins to haunt the mill man as soon as the hot, dry weather comes along can be laid with the broom and buried with the whitewash brush till his chances for a walk in the night are slim enough to make rest easy at night and insurance rates lower. The real facts in the case of most mysterious fires are that the majority of them originate from sparks falling in the dust about the mill and yard, where fire smolders along unseen until it reaches a point or object to induce flame, and then it gets into action at a lively rate. This fact has been demonstrated time and time again, not only on the point of unobtrusive smoldering in the dust, but also in the matter of sparks so insignificant as to be unobservable in daylight, frequently starting fires in unexpected nooks and corners about the mill and yard. The first remedy is to use the broom, use it persistently and unsparingly all over the mill. Beams, joists, journal boxes, and, in fact, everything that accumulates dust, no matter how inconvenient to get at, should feel the broom, and then follow with the whitewash brush, or with its modern successor, the spraying machine.

BRITISH COLUMBIA SAW MILLS

Photographed and Described by Our Travelling Representative.

THE FERNIE LUMBER COMPANY.

The accompanying illustration shows the saw mill of the Fernie Lumber Company, Limited. The company was organized by Mr. McDougall and Mr. L. M. Proctor in the year 1900, operations commencing by the purchase of the mill and limits of W. B. McClain and John McDonald at Fernie, the present mill being merely an enlargement and improvement of the one purchased. The company's entire plant consists of a saw mill, planing mill and lath mill, occupying with the yard and piling grounds a site of fifty acres, out of the 113 acres owned by the company in the locality, one mile east of Fernie, on the Crows Nest Pass Railroad. To the north flows the roaring Elk river, running for some distance almost alongside the mill. It is down this stream that the logs are driven to the mill from the company's limits some distance east, consisting of 7,000 acres of spruce, fir, pine and cedar. During the winter season they are hauled to the mill by sleighs.

The saw mill is 40 feet by 80 feet in dimensions and is equipped with circular, edger, trimmers, butting saws, log haul up, steam nigger, steam feed conveyors, etc. It has a capacity of 35,000 feet per day of 10 hours. The planing mill runs parallel to the saw mill, the lumber being carried from one to the other by live rollers. It is equipped with three planers. The lath mill has a capacity of 25,000 daily. Power for driving the machinery is obtained from two large Waterous engines and two boilers. Connected with the power house is a filing room and blacksmith shop.

The principal timber manufactured by this firm is spruce, with a slight sprinkling of tamarac and pine. Mr. Proctor assures the writer that so popular has become the demand in the Territories for this mountain spruce during the past year that they are finding difficulty in keeping up with the orders. Most of the output is marketed in the Territories and Manitoba, although during the past six years, since the advent of the coal mines in the vicinity of Fernie, a large local trade has sprung up. At the time of writing a good deal of local trade is being done in rebuilding the business section of the town which was devastated by fire in May of this year.

Mr. John Alexander McDougall, popularly known as "Sandy", president of the company, is a product of Arnprior, Ont., where he was engaged in the lumber trade from childhood. He came west in 1898, cutting timber for the projected Crows Nest Past Road and finally drifting back into the saw mill trade. Mr. L. M. Proctor, the vice-president, is a native of Ogdensburg, New York, where he was engaged in the lumber trade. He came west in 1898, working on the construction of the Crows Nest Road. Both gentlemen are men of ability and are held in the highest esteem by the citizens of Fernie.

The company purpose building in the course of a few months a logging railroad four miles long, of the standard gauge, to their limits. Power to commence with will be supplied by horses, but later will be superseded by the company's own locomotives. The estimated cost of the road will be $6,000 a mile.

SAW MILL OF THE FERNIE LUMBER COMPANY, FERNIE, B. C.

HAZELMERE LUMBER MILL.

Among the latest additions to the lumber industry of the Coast is that of the Hazelmere Lumber Mill, owned by G. M. Thrift, an experienced western logger. Building operations were commenced in January of this year and completed on May 29th. The mill is splendidly situated on the Great Northern Railway three miles from the boundary and right in the centre of some magnificent limits of fir, cedar and spruce owned by Mr. Thrift. This proximity of a plentiful supply of good logs will no doubt prove a great asset in days of keen competition, enabling the owner to save the freight charges for hauling and thus be in a position to sell cheaper than his rivals to the local trade.

The mill was designed by Mr. H. Humphreys, of Drayton, Wash. It is 100 feet long by 30 feet broad and is equipped with two Simond's log saws, rollers, log hauls, planers, with matcher and flooring machine complete. The capacity is 40,000 feet per day of ten hours.

The boiler house is separated just a few feet from the main building and is equipped with one boiler and one engine.

Although just commencing operations, they have already secured large orders from the local trade and are receiving every day inquiries from Manitoba, the Territories, and even as far east as Toronto. The mill employs thirty hands.

CUTTING LOGS FOR THE HAZELMERE LUMBER COMPANY.

D. & J. HADDEN.

The D. & J. Hadden mill, engaged in the manufacture of shingles and clear cedar, is situated at Cloverdale, B. C., eight miles from the boundary of the State of Washington and on the line of the Great Northern Railway, which has just lately tapped the growing city of Vancouver. It was built just one year and a half ago by the owners, who hail from Orillia, Ontario, being formerly owners of the Foxmead mills there.

AN ONTARIO SHIPMENT BY D. & J. HADDEN, CLOVERDALE, B. C.

The main building is 100 feet long by 50 feet wide. It is equipped with two of Johnson's upright shingle machines manufactured at the Schaake Machine Works, New Westminster, lumber rig and planer. The output is 60,000 shingles per day and 15,000 feet of cedar, all of which is marketed locally and in Ontario.

Power for driving the machinery is derived from one boiler and two engines situated in a fireproof building fully 50 feet clear of the mill. A dry kiln and machine shop are other adjuncts of the plant.

The owners, who are both bright, energetic men, full of vim and snap, always being ready to seize an opportunity, purpose increasing the capacity of the mill and going still more largely into the manufacture of clear cedar.

One Copy, Weekly and Monthly, Six Months, in advance, 50
Foreign Subscription, $2.00 a Year.
ADVERTISING RATES ON APPLICATION.

THE CANADA LUMBERMAN is published in the interests of the lumber, wood-working and allied industries, being the only representative in Canada of these important interests. It aims at giving full and timely information on all subjects touching these interests, and invites free discussion by its readers.

Especial pains are taken to secure for publication in the WEEKLY LUMBERMAN the latest and most trustworthy market quotations throughout the world, so as to afford to the trade at home and abroad information on which it can rely in its operations. Subscribers will find the small amount they pay for the CANADA LUMBERMAN quite insignificant as compared with its value to them. There is not an individual in the trade, or specially interested in it, who should not be on our list, thus obtaining the present benefit and aiding and encouraging us to render it even more complete.

Advertisers will receive careful attention and liberal treatment. For manufacturing and supply firms wishing to bring their goods to the attention of owners and operators of saw and planing mills, wood-working factories, pulp mills, etc., the CANADA LUMBERMAN is undoubtedly the cheapest and most profitable advertising medium. Special attention is directed to "WANTED" and "FOR SALE" advertisements, which are inserted in a conspicuous position on front page of the Weekly Edition.

MILEAGE AND STUMPAGE CHARGES.

The new regulations imposed by the New Brunswick Government on Crown timber lands have now been in operation a year. It will be remembered that the annual charge was increased from $4 to $8 per square mile, and the stumpage dues on spruce, pine and fir saw logs from $1 to $1.25 per thousand feet, and on cedar from 80 cents to $1.25. The result of the first year's operations has clearly shown that the advanced charges were imposed at an inopportune time, for the lumber industry of New Brunswick is now in a very depressed condition. With the high wages which have prevailed, and the fixed charges incident to the ownership and cutting of timber, the lumbermen find it almost impossible to operate at a profit.

A delegation representing the Lumbermen's Association recently waited on the Government to ask that the mileage on timber limits be reduced to the old rate of $4 per mile, this rate to continue at least until the lumber market improves. It was pointed out that the higher charges were imposed after a few years of prosperity in the lumber trade, and at a time when the signs pointed to a reaction. Since then this condition has been realized, the present season being the most unsatisfactory that has been experienced for many years. It is most difficult to place a cargo of lumber in the British market, and, with the exception of the cargoes that were sold during the early spring, very few shipments will be made to that market.

The increased mileage charges represent about $40,000 annually, while the stumpage increase amounts to approximately $43,000. The total is not a large amount, but under existing conditions the lumbermen consider it a hardship to be compelled to pay the higher rates. As it is in the interest of the Government as well as of the province that the saw and shingle mills should be operated, it is believed that the Government will at least accede to the request for a lower mileage charge.

RED CEDAR SHINGLE DIFFICULTIES.

The shingle mills of British Columbia, unlike those in Eastern Canada, can be operated the year round. The possible production is the daily capacity multiplied by the number of working days in the year. A comparatively small mill will, in the course of twelve months, produce a considerable quantity of shingles, and during a portion of this productive period the consumption of shingles is almost at a standstill. The large number of new mills which have been built within the last three years have a combined capacity greater than is generally supposed, and, taken in conjunction with the old established mills, the output has been greatly in excess of the demand. Overproduction has resulted in a demoralized market, prices having steadily weakened for some months past, until now they are at the point where the manufacturer's profit is entirely obliterated. This is all the more regrettable for the reason that the red cedar shingle is in popular favor and has always been in good demand. The North-West trade this year has been particularly brisk.

Various plans have been originated to maintain prices at a reasonable basis and prevent, if possible, serious loss to the trade. This has been found difficult of accomplishment. The large number of small mills were a great source of annoyance and even some of the larger manufacturers did not adhere to association prices, so that it soon became a question of price cutting to obtain orders, and there is now practically no standard prices. When business is brisk and orders plentiful, an association designed to regulate production and maintain prices may easily be kept together, but when heavy stocks are being carried for which there is little demand, many are apt to yield to the temptation to break away from all unity with confreres and endeavor to reduce the burden they are carrying even if at prices which represent no profit.

How best to handle the Ontario trade is a proposition to which the B.C. shingle manufacturers have given much consideration, without, apparently, arriving at a satisfactory solution. The appointment of five selling agents for the province was one of the plans inaugurated, but after a test it was found impracticable. Another proposition that has been considered is the appointment of a secretary through whose hands all orders for the Eastern trade should pass, he in turn to appoint district representatives where found advisable to do so. By some it is believed that such a plan might be successful, but others, remembering the fate of previous efforts, are skeptical.

We must confess that the immediate outlook for the B.C. shingle industry is not promising. It will probably pass through a period of reformation, during which time some of the weaker manufacturers may succumb. Some mills will be closed down and probably dismantled. Little money is likely to be made by either manufacturer or dealer. In the meantime the market will expand and a year or two hence production and supply will get closer together and the business will once more be on a substantial footing. This forecast is not very acceptable to those who have invested their money in shingle plants, but it is a fair statement of the situation, all the more deplorable because brought about solely by the shingle manufacturers themselves rather than by trade depression. Too many persons, with no experience and little capital, sought to become rich through the operation of a shingle mill. The craze for shingle manufacturing has now, we hope, spent its force, and, disastrous as have been the results, a useful lesson may have been learned.

FIRE RANGING ON LICENSED LANDS.

The Government of the Province of Quebec are about to adopt new regulations looking to the better protection of timber lands from fire. Before finally adopting the new laws it was considered advisable to ascertain the views of the limit holders, for which purpose a meeting was held in Ottawa recently. The suggestions submitted to the meeting by the Government were:

First. To increase the fire tax on limit holders from 17½ cents to 25 cents per square mile.

Second. To increase the number of fire rangers from 65 to 100 for fire districts Nos. 1 and 2.

Third. To require lumbermen to pay the whole cost of extinguishing fires instead of one-half as at present.

The lumbermen agreed to the first and second suggestions, but claimed that the Government should continue to pay one-half the cost of extinguishing fires. The discussion on the subject brought up the question as to the relative merits of the Quebec system as compared with that existing in Ontario, and the opinion of many of the licensees strongly favored the method in force in Ontario. In this province the government charges no fire tax. The limit holder is allowed to name as many fire rangers as he considers necessary for the safe protection of his limits, the cost thereof being divided equally between the Government and the licensee. The rangers are selected by the licensees, but the Department of Crown Lands reserves the right to reject or remove any person who n they consider unfit for the position. This system has provided very efficient protection, the limit holders fully realizing its benefits and availing themselves of its operation. The number of rangers employed on licensed territory has increased from thirty-seven in 1885 to two hundred and forty-four in 1903.

A comparison of the operation of the systems in the two provinces leads one to favor the Ontario system from the standpoint of both efficiency and economy. According to the last report of the Minister of Lands, Mines and Fisheries, the area of timber lands under license in the Province of Quebec was 62,730 square miles. The number of fire rangers on this territory was only seventy-two, whereas the fixed charges to be paid by license holders, according to the rate of 17½ cents per square

mile, was $10,977. Each ranger would have an average of 750 square miles of territory under his supervision, and the average cost to the licensee would be $152 per ranger. It must be admitted that seventy-two rangers are not sufficient to patrol 62,700 square miles, and the wages of all the extra rangers necessary for the proper protection of the limits must be paid by the limit holders.

In the Province of Ontario there were under license in 1903 17,033 square miles of timber limits, on which two hundred and forty-four fire rangers were employed. The cost to the licensees was $31,257. Thus there would be provided one ranger to every seventy square miles, at an average cost to the licensee of $138 per ranger. The cost of extinguishing fires is divided between the Government and the licensee.

The Ontario Government and the timber limit holders alike seem well satisfied with the operation of the fire ranging system, and other provinces might, with advantage we think, adopt this system. Unfortunately, several of the provincial governments have as yet made no provision for fire ranging. Whether or not the destructive fires which have occurred recently in British Columbia would have been prevented by a staff of fire rangers we cannot say, but no time should be lost in adopting such regulations as would be likely to reduce the danger from fire to the minimum.

EDITORIAL NOTES.

According to the Government reports, for the period of ten months ended April 30th of the present year, lumber was imported into Canada, largely from the United States, to the value of $4,676,556, as against $2,920,876 in the corresponding period of the previous year. Thus American lumber sent into Canada almost doubled in value in the last ten months, as stated.

Occasionally argument is heard against the imposition of an import duty on United States lumber. A gentleman who deplores the idea of taxing raw material, and who has given some study to the Canadian timber supply, points out that increasing difficulty is being experienced by lumber dealers and contractors in securing bill stuff in Canada. He claims that white pine has become too valuable to be used for that purpose, and that it is almost impossible to get a large order for dimension timber executed by the white pine mills. For this reason he argues that we must import southern pine. His remarks, of course, were intended to apply particularly to Ontario. It is an argument that has not been advanced heretofore to our knowledge, and one which is entitled to some consideration.

The lumber manufacturers of Nova Scotia are likely to adopt a wise policy in connection with the coming winter's logging operations. In view of the prevailing depression in the British market and the low price of spruce lumber, there is a strong feeling in favor of curtailing the production of logs, a decrease of 50 per cent. being spoken of. A meeting of the Lumbermen's Association will be held at an early date, at which such action is likely to be agreed upon. It is probable that it will also be decided to hold such lumber as is now on hand rather than attempt to market it in Great Britain. Such a policy is to be commended and we sincerely hope that it may be strictly carried out. Timber is too valuable to be sacrificed, and it will make more money for its owner by being permitted to stand in the tree than if cut down and sold at an unfavorable time.

We wou'd direct the attention of our readers, and especially the retail dealers of Manitoba and the North-West Territories, to the large number of lumber and shingle manufacturers of British Columbia now advertising the products of their mills in the columns of the monthly and weekly issues of THE CANADA LUMBERMAN. The list includes some thirty-five of the largest firms in the province and represents an invested capital of about $20,000,000. During the past twelve months these manufacturers have marketed their stocks in Manitoba and the Territories in the face of considerable difficulties and disadvantages, such as excessive freight rates and the competition of surplus stocks of low grade American lumber; but, with this latter evil eliminated, as we hope it will be, the volume of trade is certain to assume very large proportions. This is as it should be, and we feel convinced that the longer the acquaintance of the buyer with the B. C. mill products, the more convinced will he become of their excellent qualities, and we assure all retailers that they will do well when in search of lumber to carefully consider the B. C. product.

Subscribers are expected to send us lumber news items from their locality. Don't neglect to advise us of all improvements, business changes, etc.

IMPORTS OF FOREST PRODUCTS

The following table shows the value of the products of the forest imported free of duty into Canada from the United States during the months of March, April, May, and June, 1904. The table is compiled from the unrevised monthly statements of imports and exports issued by the Department of Trade and Commerce:

Class of Timber.	March. Value.	April. Value.	May. Value.	June. Value.
Sawed or split boards, planks, deals and other lumber	$207,405	$260,904	$236,800	$388,904
Logs and round unmanufactured timber	29,894	11,062	17,885	84,487
Timber or lumber, hewn or sawed, square or sided	6,489	29,967	11,705	46,005
Cherry, chestnut, gumwood, hickory and white wood	45,861	42,633	55,561	48,625
Oak	122,823	137,252	125,926	164,382
Pitch pine	14,887	19,562	29,745	69,401
Mahogany	4,342	15,259	5,885	6,840
White ash	15,279	9,770	14,469	10,155
Walnut	2,855	9,259	4,161	4,616
Spanish cedar	322	313	317	
African teak	1,498	316	139	586
Pine and spruce clapboards	1,651	747	361	18
Laths	3,335	7,379	4,825	10,139
Shingles	1,621	3,058	693	976
Staves	16,502	8,013	15,011	8,465
Shovel handles	6,520	2,209	2,698	7,370
Felloes of hickory, rough sawn to shape only	1,936	2,560	4,412	2,834
Handle, heading, stave and shingle bolts	4,136	1,526	4,291	381
Hickory billets	555	79	110	979
Hickory for spokes of wheels	390	253	244	76
Hickory spokes, rough turned	27,279	29,860	18,027	22,144
Hubs for wheels, posts, last blocks, etc	4,219	2,596	3,287	4,138
Fence posts and railroad ties	4,346	13,572	8,830	28,693
Total	$524,265	$609,169	$625,382	$910,214

EXPORTS OF FOREST PRODUCTS

The following table shows the value of the products of the forest exported from Canada to the United States during the months of March, April, May, and June, 1904. The table is compiled from the unrevised monthly statements of imports and exports issued by the Department of Trade and Commerce:

Class of Timber.	March. Value.	April. Value.	May. Value.	June. Value.
Planks and boards	$205,830	$347,191	$523,091	$1,572,224
Basswood lumber	332	756	425	1,866
Pine deals	237	1,338	7,890	7,508
Spruce and other lumber	.....	12,696	7,819	15,227
Laths	28,391	29,857	54,830	135,431
Pickets	238	341	6,245	18,586
Scantling	3,387	1,698	16,230	16,267
Shingles	75,378	1,6,429	153,137	252,697
Shooks	1,605	379	6,943	7,250
Staves and headings	4,217	4,256	8,382	12,840
Telegraph and other poles	1,155	4,924	1,990	6,205
Cedar and tamarac posts	.....	1,397	2,262	7,856
Shingle bolts	500	138	350	180
Sleepers and railroad ties	5,816	12,493	14,327	34,496
Stave bolts	701	113	163	930
White pine timber	574	.....	.....	25
All other square timber	431	507	265	808
Pulp wood	117,229	142,204	163,225	277,531
Lumber not elsewhere specified	3,480	5,783	14,195	17,868
Cedar logs	90	.....	700	4,920
Elm logs	24	370	70	1,115
Hemlock logs	576	48	15,497	1,343
Spruce logs	2,702	2,958	33,221	5,937
All other logs	16,692	10,429	30,747	63,399
Total	$469,585	$716,305	$1,062,004	$2,462,509

THE WINNIPEG EXHIBITION.

Office of the CANADA LUMBERMAN,
McIntyre Block, August 19, 1904.

Since our last issue Winnipeg has been the centre of great excitement on account of the Dominion Exhibition and almost every line of trade has been influenced thereby, but probably the one to be least affected in this regard is the lumber trade. It is true that, during the preparations, a quantity of lumber was of necessity called into requisition, from which a certain benefit accrued, but, generally speaking, business in these lines has gone on in the usual manner. There are distinct indications that the rush of trade that commenced with the opening of the season has now found its level, and things are steadying down, awaiting the results of the coming crops. Money, too, is getting very tight, attributed generally to the indisposition of the Banks to accept farmers' paper, their adverse experience of last year making them unusually cautious. However, should the harvest be up to expectations, the financial aspect will immediately improve, and a move in trade will be looked for in consequence.

There are also indications of improved conditions with the B. C. mills. During the opening months of the year the trade was greatly favoring the U. S. mills, and much anxiety was expressed, but lately there has been a better proportion of trade going to mills on this side, owing probably to prices showing a better parity.

LUMBERMEN'S TOOLS AT THE DOMINION EXHIBITION.

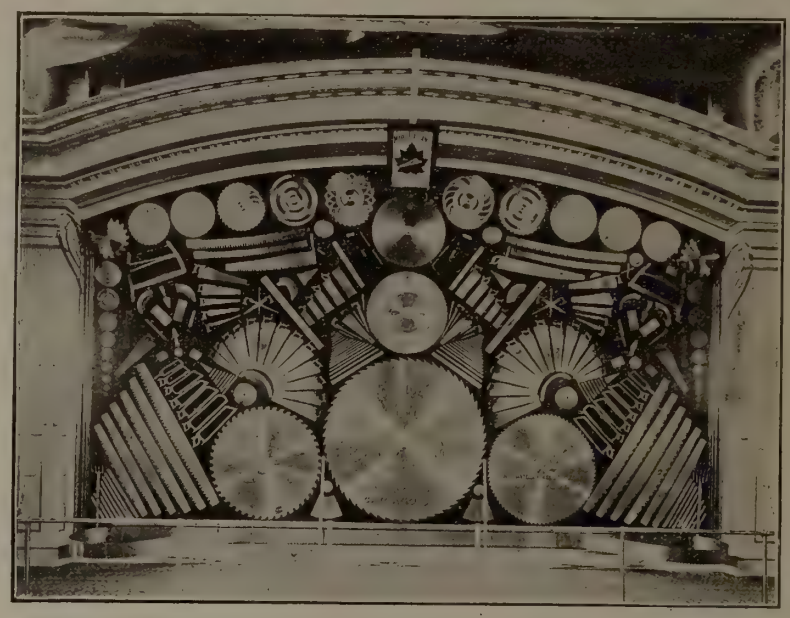
Among the several exhibits in the Machinery Hall of the Winnipeg Exhibition which attracted universal attention was that of Shurly & Dietrich, of Galt, Ont. This firm had a prominent position across one end of the building, the wall of which was arranged with a circular display of their various tools and implements, mounted on dark purple plush, the centre-piece being a fine circular saw 7½ feet in diameter, the largest crucible steel plate that has been made. Arranged around this in artistic form were samples of their many tools. There were their "Maple Leaf" lance cross-cut saw and hand saws of the same brand, the quality of which is well known on account of this firm's special secret process of tempering. It is a noticeable feature that Shurly & Dietrich are the only Canadian firm who are doing an export trade in these goods with Australia, New Zealand and United States, which fact speaks well for the quality of their goods, since this has been done in the face of a duty of 30 per cent. They also had on exhibit samples of their harvest tools, which are manufactured by and under the style of the "Maple Leaf Harvest Tools Company," of Tilsonburg.

Another exhibit of great interest to lumbermen was that of the Dundas Axe Works, Dundas, Ont. This firm exhibited a fine collection of double and single bit axes in both overcoat and insert steel, prominent among which was to be seen their well known "Crown Jewel" axe, which we understand is gaining a place in the front ranks among lumbermen.

The James Smart Manufacturing Company, of Brockville, Ont., showed an attractive range of lumbermen's axes and other tools, together with their stoves and generators.

WOOD-WORKING MACHINERY.

The Goldie and McCulloch Company, of Galt, Ont., had a fine location extending across the centre of the Machinery Hall, in which they made an interesting display of their machinery, comprising an Ideal high-speed enclosed self-oiling engine, a ten inch moulder, a full set of Philbrick patent adjustable matcher heads, etc.



DOMINION EXHIBITION, WINNIPEG—EXHIBIT OF SHURLY & DIETRICH.

The Robert Bell Engine and Thresher Company, of Seaforth, Ont., had in operation on the Exhibition grounds some very powerful 20 h.p. traction and portable engines, particularly adapted to saw mill work. They also had on exhibit one of their No. 0 portable saw mills suitable for 12 to 30 h.p. This company received some very excellent testimonials regarding their engines and machinery.

The E. Long Mnfg. Company, of Orillia, Ont., had on exhibit in the Machinery Building a creditable display of various machines, noticeable among which were their Clipper shingle machines, Lockport swing saw mills, a three saw double edge lathe and picket machine, a saw carriage and frame, and double geared log haul-up. There was a good deal in this exhibit of an attractive nature and much attention was given to it by the various visitors.

The A. R. Williams Machinery Company, of Winnipeg, displayed a range of lathes, drills and wood-working machinery, and also a complete outfit for saw-mills, with engines and boilers. This firm, whose address is 45 Notre Dame street east, carry in stock a full line of all necessary mill and machinery outfits.

The Canadian Iron and Foundry Company, of St. Thomas, Ont., showed samples of their "trolley" wheels, high grade machinery wheels and grey iron castings.

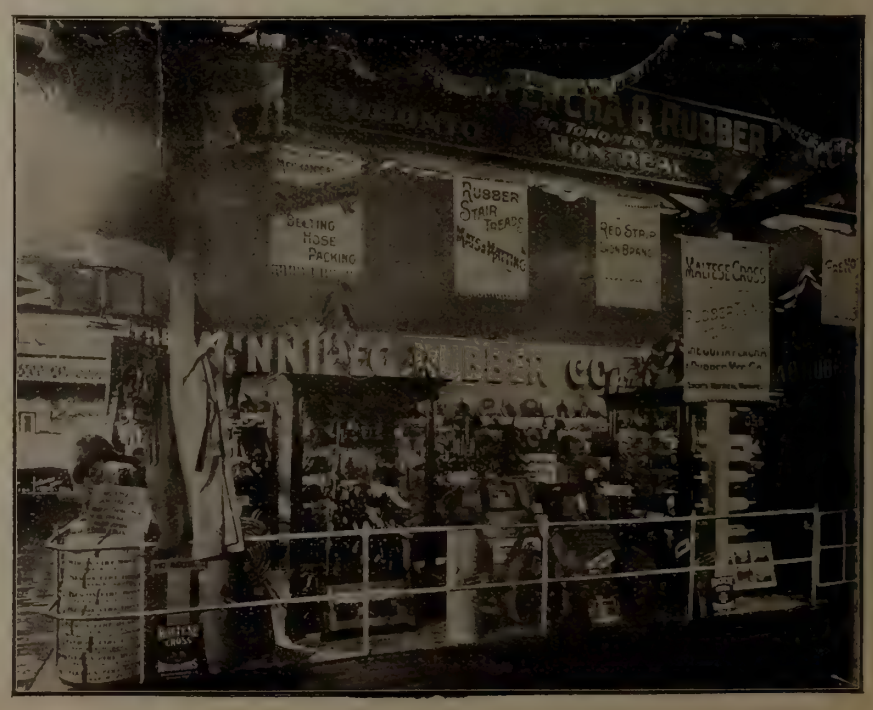
The Stuart Machinery Company, of Winnipeg, the Western agents of the E. Long Mnfg. Company, Orillia, had a fine showing of wood-working machines, a prominent feature being their log frame and saw carriage, for which they claim special advantages over other makes. It has an extra wide friction drive, an entirely new saw guide, extra size wheels on log frame, which ensures special ease in running, and a new adjustment to drive, which minimizes wear and tear. They also showed surfacers and matchers, exhaust fans for the removal of dust and shavings, emery wheels and saw sharpening outfits.

The Northern Iron Works, Winnipeg, had an attractive display arranged with their own fencings and crestings, painted in colors, enclosing their space. They had on exhibit shafting, boxes, and all kinds of machinery castings, as well as an outfit of circular saws.

The Waterous Engine Works Company, of Brantford, Ont., had one of their No. 7 fire engines on exhibit in the grounds of the Exhibition. This engine, all cold, can be started in two minutes and in less than five minutes will be throwing a stream of water 100 feet high. At a test at Red Deer it threw two streams with the wind 150 feet and with side-wind 136 feet. Through a line of 1,000 feet hose it is capable of projecting a stream of water through a one-inch nozzle 100 to 120 feet, according to wind, or two lines 500 feet with 2¾" nozzles simultaneously 100 feet.

The western selling agents for the Gutta Percha & Rubber Manufacturing Company, of Toronto, had an excellent display of rubber goods, with a special show of their well-known brands of belting and hose foremost amongst which is their "Maltese Cross" special stitched belting, made particularly for dynamos and mill purposes. Their other brands, viz., "Monarch," "Red Strip" and "Lion Brand," were also well in evidence. Their display of fire hose, made under the various brands of "Eureka," "Paragon" and "Red

DOMINION EXHIBITION, WINNIPEG—EXHIBIT OF PENBERTHY INJECTOR COMPANY.



DOMINION EXHIBITION, WINNIPEG—EXHIBIT OF GUTTA PERCHA & RUBBER CO.

Cross," was also very attractive. The brand known as "Guttaperch," we understand, is a make of special excellence, and has been approved by the Board of Underwriters, it being especially antiseptically treated and made particularly to meet the most severe requirements.

The Penberthy Injector Company, of Windsor, Ont., had a very fine display of their injectors, connected and arranged to form a barrier rail to their space. They had also a series of stands showing every size and pattern made. An interesting feature of this exhibit was a machine in full operation for making the Penberthy injectors. With the exception of perhaps one or two, all the machines at work on the grounds were fitted with this company's injectors.

The exhibit of the Metallic Roofing Company was in charge of their Winnipeg agent, Mr. Thomas Black. The had four panels of wall designs and two panels of zinc and copper ornaments, these making a wall 12 feet high and 36 feet in length. In front of this wall was a platform extending 18 feet, on which was shown panels of ceiling designs and other lines of their manufacture. Their famous "Eastlake" shingle was shown as applied in actual work, as were also their "Spanish" tile, "Diamond" tile, "Gothic" tile and "Empire" shingles.

The lubricating industries were represented by the Imperial Oil Company and the Canadian Oi Company, of Toronto, and McColl Bros. & Co., of Winnipeg, all of whom displayed their goods in attractive booths.

The Henderson Roller Bearing Company's exhibit was one which attracted a good a good deal of attention, and was interesting as showing the great advantage in economizing power which a bearing of this description has. A large roller, weighing 5,648 pounds, was mounted on this bearing and was driven throughout the entire fair time by an ordinary fishing line. On an ordinary shaft were mounted three wheels, one an ordinary brass journal, the second on ball bearings, the third mounted on Henderson's roller bearings. The shafting was mounted on pedestals and revolving on the Henderson roller bearing, being driven by a silk thread.

TRADE NOTES.

The Canadian Casualty and Boiler Insurance Company, of Toronto, have opened an office in Winnipeg, in charge of Mr. W. O. Tassie.

The Fairbanks Company, of Montreal, have just acquired the plant of the Northrop Iron Works, at Valleyfield, Que. The company purpose commencing operations immediately for the manufacuure of brass and iron goods.

The firm of Burridge & Cooper, machinery dealers, Winnipeg, have formed a joint stock company, which is capitalized at $50,000. The officers are: President, James Burridge; vice-president, E. F. LeGrasley; secretary-treasurer, Alfred LeGrasley; manager sales department, E. S. Cooper; manager electrical department, F.A. Fry; manager mechanical department, C. Sifton.

The A. J. Burton Saw Company, Limited, of Vancouver, B.C., have completed their new works and are now in a position to supply inserted tooth shingle and band saws, file room machines and tools, bits and shanks, etc. This company are agents for British Columbia for the well-known saw firm of R. Hoe & Company of new York, and under the able management of Mr. A. J. Burton we predict a prosperous future for them.

DOMINION EXHIBITION, WINNIPEG—EXHIBIT OF E. LONG MFG. COMPANY.

Mr. M. L. Killam, of Truro, N.S., has secured a patent for an auxilliary saw guide and self adjusting sett collars that are placed on saw arbors and are now used in circular saw mills. His claims are as follows: They are giving perfect satisfaction, as any sawyer can use them. They guide the saw perfectly in every cut without moving the front guide, and by this improvement and saw guide to top of saw it is no troublle to run thinner saws. It has cut more and better lumber than ever before sawn on circular saw mills. When sett collars are properly placed on the arbor it is impossible to heat or damage the saw in any way, as it has been tested, and when using top guide it keeps the saw in the right place and no time is lost when a larger log comes than will go under the guide, as it is hinged at right angles from the saw. When the large log comes in contact with the guide it moves out of the way and when the log returns back the guide is then pulled back by means of a small cord at the sawyer's hand, no time being lost at any movement of the carriage, and the carriage or the log can be moved back at any part of the cut, while the guide is in perfect safety of any accident. When using these attachments the saw should be in perfect line with the carriage and a guide at opposite directions from the one in front of saw, only on log side of saw, to keep saw from tipping against log. Further particulars, prices, etc., may be obtained by those interested by writing The Oxford Foundry & Machine Company, Oxford, Nova Scotia.

PUBLICATIONS.

"Tools for the Care of Saws" is the title of the latest catalogue issued by the William Hamilton Manufacturing Company, of Peterboro, Ont, who have lately entered into an agreement with the Covel Manufacturing Company, of Chicago, whereby they secure the sole right to build their saw sharpening machinery in Canada. All the Covel machines have been brought strictly up-to-date.

A booklet recently to hand is devoted to the Cape Town International Industrial Exhibition, which will be opened at Cape Town, South Africa, in November next and continue for three months. We learn that several hundreds of the leading firms covering practically every branch of industry in which South Africa is interested have arranged to exhibit, and that the Exhibition is now regarded as an assured success.

The American Wood-Working Machinery Company, 136 Liberty Street, New York, have just issued Catalogue "B" referring to special planing mill machinery. While in this catalogue there are illustrated only a few of the many machines which this company manufacture that are specially adapted for planing mill use, yet it represents the latest improvements in wood-working machinery, and should be in the possession of all persons interested in the manipulation of timber. They have also published a pocket edition of their 1904 catalogue, by means of which a full line of machinery is presented in as compact a manner as possible, and have now in course of preparation Catalogue "C" of sash, door and blind machinery, and Catalogue "D" of furniture machinery.

The pulp rates from Chatham, N. B., to Eastern States points have been placed on a par with those from St. John.

Canadian exports to South Africa last year amounted to $1,931,541. For the calender year of 1902 the imports of the South African colonies amounted to $242,000,000, the United States sending goods in that year to the extent of $22,000,000. With the aid of the preference and the direct line of steamers lately established between the Dominion and South Africa, Canada ought to successfully compete with the United States in such articles as bicycles, flour, chairs, agricultural implements, cotton, lumber, doors, sashes, blinds, household furniture, dairy products, musical instruments, carriages and harness, hay, condensed milk and provisions.

HOO-HOO CONCATENATION AT WINNIPEG.

A concatenation of the Hoo-Hoo order was held at Winnipeg on August 4th, with a goodly attendance of members, as many persons were in the city on account of the Dominion Exhibition. The proceedings took place amid great enthusiasm, the introduction to the light of Hoo-Hooism of some eight new kittens gave rise to the usual degree of joviality and good will, and the usual initiatory formalitieswere carried through with a strictness and precision worthy of a religious duty and to the entire satisfaction of the members and officers present.

After the completion of the concatenation ceremonies, a banquet worthy of the occasion was given to the "new kittens". Those initiated were: R. Lockhart, Fort William; W. Martin, Wapella; H. S. Galbraith, Winnipeg; M. M. Boyd, Winnipeg; C. Mader, Seattle; W. P. Dutton, secretary Red Deer Lumber Co.; A. Tennant, Rat Portage Lumber Co.; W. Springate, Brunette Sawmill Co.

The officers in attendance were: G. B. Housser, Viceregent; A. McKinney, Senior Hoo-Hoo; J. G. Foss, Junior Hoo-Hoo; J. C. Graham, Bojum; J. L. Spencer, Scrivenoter; W. B. Tomlinson, Jabberwock; D. B. Sprague, Custocation; D. L. Lincoln, Arcanoper; D. J. Macdonald, Gurdon.

The order is one which gives itself strictly to the promotion of social fellowship and good feeling amongst its members, the membership being limited to those who are directly interested in the lumber trade.

PROGRAMME THIRTEENTH HOO-HOO ANNUAL.

WEDNESDAY, SEPTEMBER 7.

Annual meeting of Osirian Cloister, probably in forenoon.

Afternoon—Initiatory ceremonies of Osirian Cloister.

Evening–Annual Banquet of Osirian Cloister.

(All the officials of Hoo-Hoo will probably reach St. Louis by the morning of Wednesday, September 7, and while the Osirian Cloister is in session, or between the meetings of the Osirian Cloister, these officials of Hoo-Hoo will arrange to get in the best possible shape for expeditiously handling of varous matters to come before the business sessions of Hoo-Hoo proper; probably a number, if not all, of the committees can be appointed by the Snark.)

THURSDAY, SEPTEMBER 8.

Thirteenth annual meeting of Hoo-Hoo called to order at 9.09 a.m. by Snark Vietmeier; roll call for quorum; speeches of welcome to be delivered probably by Hon. David R. Francis, President Louisiana Purchase Exposition, response by Senior Hoo-Hoo Frank N. Snell; address by Dr. Tarleton H. Bean, of the Department of Forestry, and by Mr. J. A. Freeman, official orator, "Yellow Piners"; annual address of the Snark; annual report of the Serivenoter, announcement of regular committee, and any other business that may appear proper to come before this first session. When adjournment is taken, it will likely be for all day, and the afternoon will be devoted to such entertainment features as our St. Louis hosts will tender.

FRIDAY, SEPTEMBER 9.

Business sessions resumed at 9.09 a.m. Reports of committees, action on reports and new business. When adjournment is taken, it will likely be for all day, the afternoon being devoted to such entertainment as is provided.

Evening—Annual Hoo-Hoo Concatenation.

SATURDAY, SEPTEMBER 10.

Business sessions resumed at 9.09 a.m. and continued all day if necessary to complete the business. The election of officers will occur in the afternoon of this day.

A LUMBERMAN'S PICNIC.

Hon. Peter White, of Pembroke, Ont., gave a picnic to his employees and their friends at Golden Lake on August 4th, at which nearly seven thousand persons were present. Everything was provided free by Mr. White, and in addition all the employees were allowed full pay. For the purpose of satisfying the appetites of the large crowd, there were provided 1,350 pounds of cooked meats, 300 pounds of pork, 1,300 pounds of beef, 1,000 loaves of bread, 300 pounds of beans, 150 dozen buns, 800 pounds of cheese, 100 pounds of biscuits, 150 pounds of jam, 50 pounds of tea, 75 pounds of sugar, and cigars, soft drinks, fruit, cake and candy galore. Among the industries represented were the saw mills of the Pembroke Lumber Company and A. & P. White, the National Manufacturing Company's establishment, Pink's machine shops, the Pembroke Milling Company, and the Pembroke Navigation Company. A splendid programme of sports and music was provided and thoroughly enjoyed.

THE "HOE" SAW EXHIBIT.

Among the many handsome and interesting exhibits in the Liberal Arts Building at the Louisiana Purchase Exposition, that of chisel-tooth saws shown by the firm of R. Hoe & Company is among the most interesting. This firm are also manufacturers of printing presses, which acccounts for their exhibit being located in the Liberal Arts Building.

The saws are by no means the most uninteresting part of the exhibit, and seem to attract the attention and admiration of visitors quite as much as the more intricate printing presses. R. Hoe & Company's specialty is the inserted-tooth circular saw, of which they were the originators and inventors. These saws have been in use for many years, and their superiority over solid saws for almost every kind of work has been thoroughly demonstrated. It is claimed that there is no finer inserted-tooth saw made than that manufactured by R. Hoe & Company.

The accompanying picture shows a small section of the exhibit. The stand at the left side shows the name "R. Hoe & Co." artistically worked out in bits and shanks. The saw in the middle is six feet in diameter. On the left of the large saw is a small solid saw, with the date 1824 above it also made with bits and shanks, and on the opposite side is a small chisel-tooth saw with the date 1904 above it. This shows that R. Hoe & Company not only consider the chisel-

EXHIBIT OF R. HOE & COMPANY AT THE ST. LOUIS WORLD'S FAIR.

thoth saw the circular saw of the twentieth century, but also qat they have been manufacturing saws for eighty years—touite an enviable record.

A handsome mahogany glass case contains samples of the different styles and sizes of bits and shanks, also a complete assortment of saw tools. The saws, of which there are a dozen or fifteen, varying in size from 12 inches to five feet, are held in a simple but artistic stand in such a way that they can be easily removed and shown in detail to those interested.

Several of R. Hoe & Company's friends have been so pleased with the work accomplished by their saws that they have sent, not only testimonials, but samples of the work done by them, showing that the saws will cut iron as well as wood. Several of these relics have been exhibited; among others a horse shoe is shown sliced off by a saw. In some way the shoe had become imbedded in the tree. No damage was done to the saw, other than the dulling of a few teeth. Another relic has been sent by Messrs. Chas. Smith, Jr., & Sons, of Mt. Vernon, Indiana. Their letter reads as follows: "We cut into a 5/8" bolt of iron twice the other day with your chisel-tooth saw and did not injure the saw."

R. Hoe & Company have spared no pains to make this a handsome exhibit, and they certainly deserve the greatest r edit for their patriotism and liberality.

NEW ONTARIO FORESTS.

Mr. Archibald Henderson, who is one of a party now exploring the region to the west of Lake Abittibi, writes to the Toroto Globe regarding the timber as follows:

Along the rivers, and for the most part the creeks also, the country naturally appears at its best. The most valuable timber, as also the soil promising most for the agriculturist, is here found. White spruce as large as 32 inches in diameter, averaging sixteen inches, aspen and balsam poplar some 28 inches, aver aging fourteen inches, are the most valuable trees. Mixed with these are the smaller black spruce, white birch and balsam. Such a forest unfortunately extends from only two or three chains to half a mile inland from the waterfront. This is not as serious as might seem at first, however, as the whole country is drained by numerous small unnamed rivers and creeks, as yet not marked on any map, besides the large rivers, and each of these as a rule has sloping banks, in some cases from 30 to 40 feet high, and timbered almost as well as the usually somewhat higher banks of the larger rivers. The subsoil in such localities is a heavy clay, covered with several inches of vegetable mould, and supporting besides the timber a rich flora.

Inland from the rivers and creeks the character of the country changes very considerably, and in various areas assumes four different aspects. By far the greatest part is well wooded with black spruce, in size up to thirteen inches, averaging probably seven inches. These grow on a clay soil overlaid with two or three feet of humus, which again supports moss to the extent of about eight inches. Many of these spruce woods are quite wet and the mossy floor is of a sphagnous nature, while in other drier localities the floor is largely composed of Bryaceous mosses. Scattered through the black spruce are many tamarac, which in wetter areas are collected into tamarad swamps. These trees, unfortunately, are dead almost without exception, having been killed within recent years by the larch sawfly in these areas.

Are your Facilities for Handling Glue and "Glued-up" Stock Strictly Up-to-date?

And even though you answer Yes, are you sure you are familiar with the most modern machinery for this important branch of wood-working?

If you will ask us for Catalogue No. 1367

You will find it presents a very complete line of the latest things out for handling glued stock of all sorts. Glue Spreading Machines, all manner of Glue Clamps, Glue Boilers, Heaters and Cookers, Contact Glue Heaters, etc., etc. Write for copy and be sure to mention the number, 1367.

AN WOOD WORKING MACHINERY CO.

136 Liberty Street, NEW YORK CITY.

THE Wood-Worker and Retailer

GLEN COVE BOSS TIMBER SIZER.

The accompanying engraving illustrates the Glen Cove Boss timber sizer, built by the American Wood Working Machinery Company. This is claimed to be the heaviest and most powerful as well as the simplest and most easily handled machine of this class on the market. It is fully up to date in design, simple in construction and all material and workmanship are of the very best. The parts liable to breakage are reduced to a minimum and a complete system of numbering and lettering applied, which is a great convenience when ordering necessary repairs.

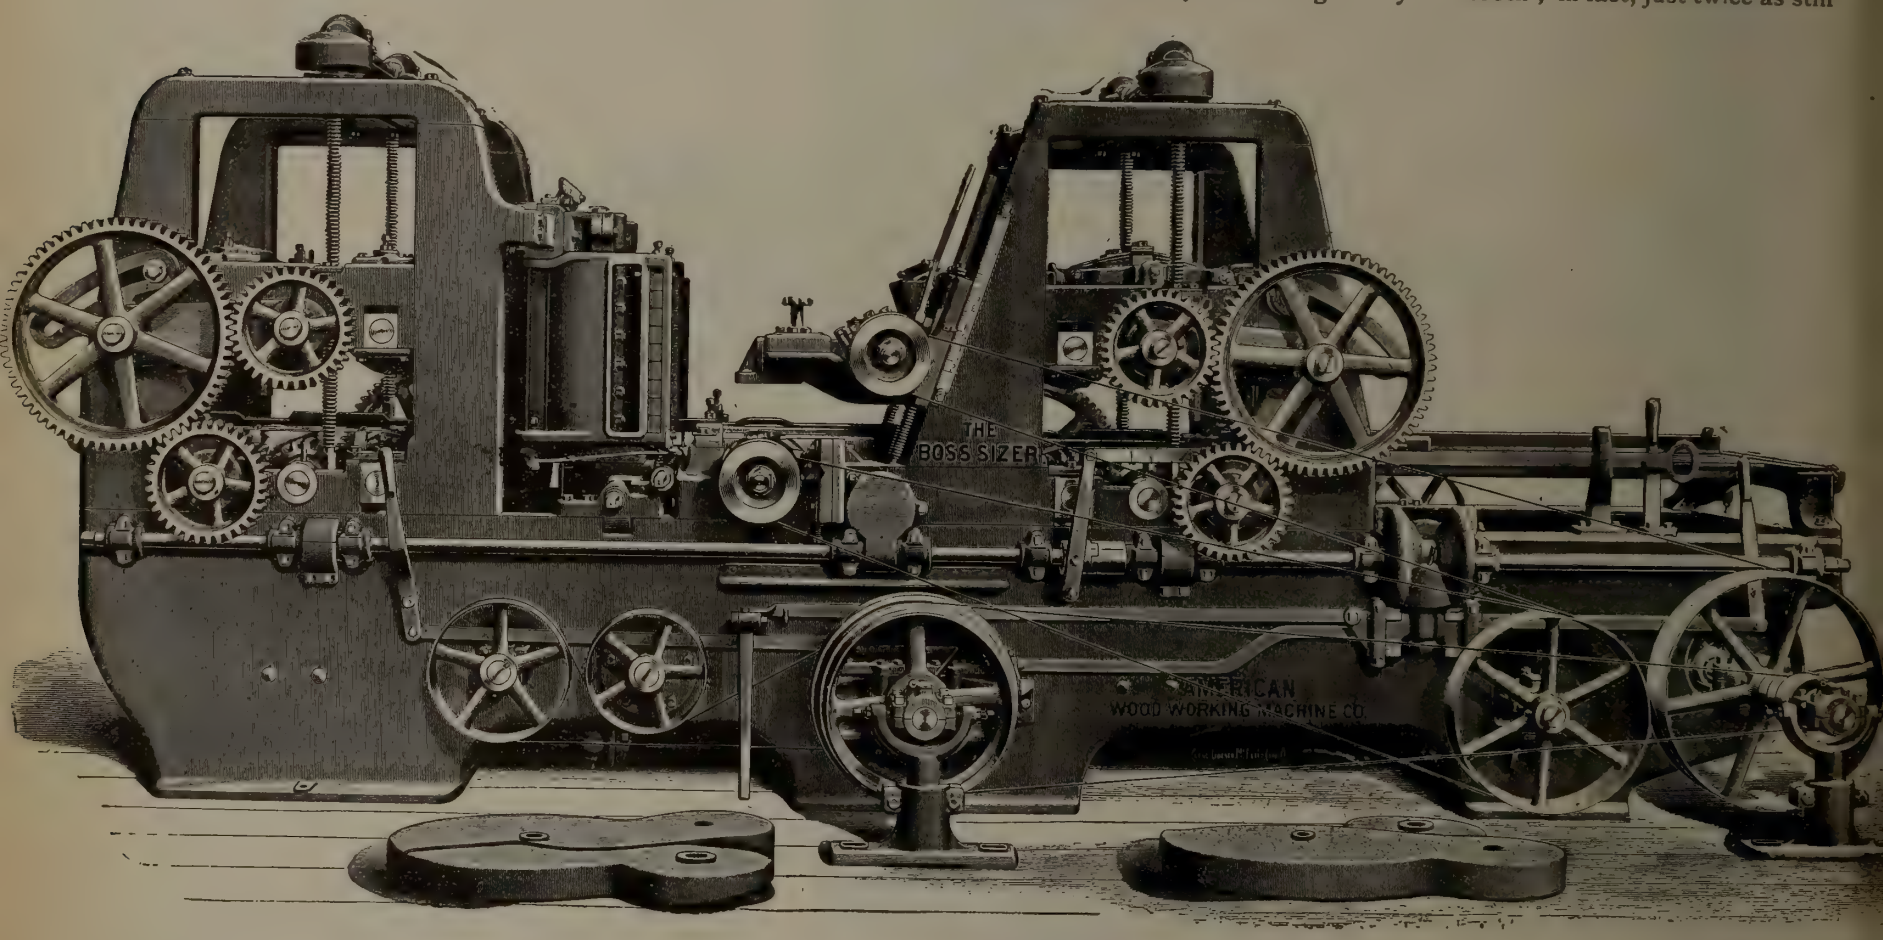
This machine is built to work 30 × 20 inches, 30 × 18 inches, 30 × 15 inches and 20 × 20 inches, with eight feed rolls; also 30 × 14 and 30 × 12 inches, with six feed rolls. The accompanying illustration shows the 8-roll machine.

All of the adjustments are easily and quickly made and those necessary for a change from one class of work to another are all made from the operator's positions at the side or end of the machine, and so easily and quickly as to make this machine capable of covering a very large range of work from surfacing four sides (full capacity of the machine) to car sills, flooring, decking or any similar work.

The frame is substantial, the sides are heavily ribbed and cross girts are all planed to a seat and strongly bolted, and all the upper work applied in a way to add strength and stability.

The feed is exceptionally powerful. All rolls are geared at both ends. The first two top rolls are divided, except in the 20 × 20 inch machine, where the rolls are solid. All top rolls are independently weighted and rise and fall parallel with the bottom rolls. The feed as well as the power hoist is handled from the operator's position from the end and side of the machine. The feed hoist is very effective and is available when the feed is on or off.

The manufacturers will be pleased to send illustrated circulars giving a complete description of all details and other information upon application, and our readers are requested to address the office nearest to them as follows: American Wood Working Machinery Company, 136 Liberty St., New York City, or The Fairbanks Company, Vancouver, B. C.



GLEN COVE BOSS TIMBER SIZER.

CUT-OFF SAWS.

The writer recently paid a visit to a well-equipped factory, where everything seemed to be working in fine order except one cut-off saw and a trim saw. Talking to the manager, he asked about men and machinery, stating that his sawing did not come along as it ought, and escorted me to the place where the sawing was done. Everything was neat and tidy, but the saws certainly needed attention. The first suggestion was to joint up the saws, which were out of true. The next was to shape the teeth, which were bad for the kind of work being done.

The saws in use for stock sawing were like those shown in Fig. 1. This kind of saw has been in use many years, and, when properly cared for, can be made to do very smooth and accurate work, but where large amounts of everything and anything must be cut quickly and accurately, the style shown in Fig. 2. should be used. This saw, with a little set, properly jointed and filed, will do an enormous amount of good work. Note the difference: the sketches will explain more than could possibly be told in words. Take particular notice of the position of the teeth while in the cut. A and B represent the board or plank. The writer, after many years of study and practical experience, prefers the one shown in Fig. 2.

In the saw shown in Fig. 1 there is no possible chance of the teeth carrying the sawdust through the cut. It will be noticed that both the front and back of the teeth, if the lines were continued, would all meet on a line just one-fourth the diameter of the saw, thus making a very stiff tooth; in fact, just twice as stiff as the one shown in Fig. 2—a very good thing in its favor, but not nearly so important as the good cutting edge, which is just about twice as good as Fig. 1, although the tooth is only half as strong.

Progressive manufacturers are looking for a tool that will do good work and lots of it. The saw shown in Fig. 2 is just as smooth a cutter as can be made of that shown in Fig. 1, but it must be kept in good order, or the tide may be turned in favor of Fig. 1. There is no tool so badly abused as the circular saw. Every man thinks he can run it, and in fact he can, but how? It is not a particularly hard job to keep wood-working tools in order if men will only think a little.

FOR THE CAMP—

We have a very suitable lot of goods for camp supplies. We make this kind of trade a specialty. You who are not getting suited just as well as you would like, try us for your next order, and give us a chance to demonstrate our ability to give you satisfaction in this very important department of your business.

H. P. ECKARDT & CO.

Wholesale Grocers - - TORONTO

Now let us true up and sharpen the saw shown in Fig. 2. To begin with, take a piece of grindstone or emery wheel and true the saw while it is running. Be sure the sides of the teeth are not touched by staying in one spot in the stone, for if the teeth lose their sharp corners by becoming round by wearing a groove in

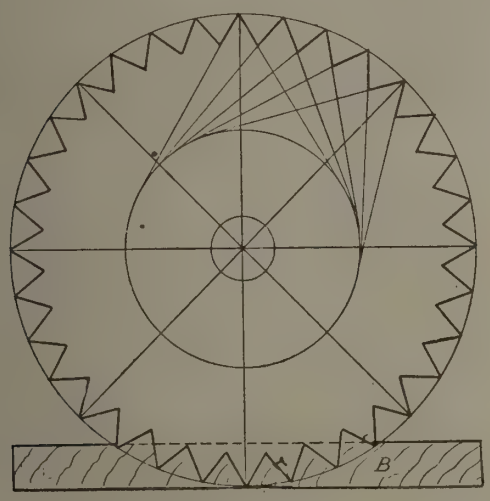


FIG. 1.

the stone, the operator has done more damage than good. Whichever saw is to be used, file the teeth beveling on the face and back, and every other tooth in the other direction; in other words, from the other side of the saw. Do not get too much bevel to teeth, for if you do you are sure to have trouble; the extreme points

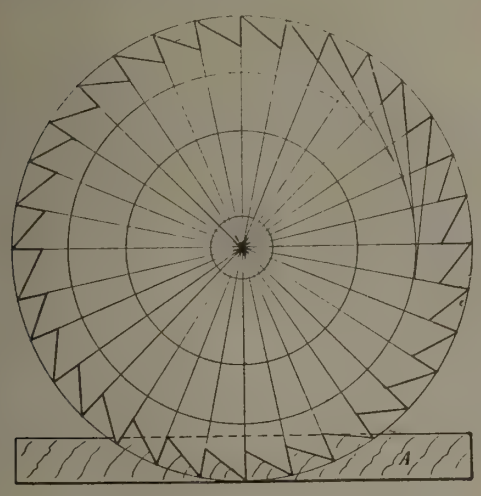

FIG. 2.

of the teeth become too thin and weak and can not stand up to the work. Study the nature of the material being worked, and, it possible, have the saws filed and fitted accordingly. When this is done, very little trouble will be experienced in doing good work and lots of it

For rough and ready stock cutting, use a straight gauge saw with very little set, but for trim sawing, where true and smooth work is required, use a hollow-ground saw with no set. As for the shape of tooth to select, if it is hard and heavy cutting, needing great strength, use the one shown in Fig. 1; if for the ordinary run of work, use the one shown in Fig. 2. Should it be desirable to have a combination rip and cut-off saw, all that is necessary is to file every third or fifth tooth square across. These teeth carry the sawdust through the lumber, which is necessary in ripping. The one thing to be careful about is not to have the square or rip teeth longer than the bevel or cross-cut teeth. In this way one gets a very smooth cutter for either ripping or cross-cutting.—"W. H" in The Wood-Worker.

STAVE BOLTS BY THE POUND.

The Indianapolis Woodworker, speaking of a pencil slat factory in Tennessee that is buying cedar timber by the pound, paying at the rate of 6 cents a pound therefor, brings to mind again the question of buying certain kinds of timber by the pound instead of by the cord or per thousand feet. Down in West Virginia there was a stave factory that once made it a practice to buy slack-stave bolts by the pound instead of by the cord. A wagon scale was made use of, and by frequent comparisons with the weight and measure a system of weights was designed for the different kinds of wood, so that when a farmer came to town with a load of bolts it was a simple matter of weighing in and then weighing the wagon out. This practice probably still holds at that place, for it was said to give very good satisfaction and to make the problem of measuring much easier than when it was necessary to cord the stuff up, but for some reason the idea has never taken well with the trade as a whole. In fact, it does not seem to have met with favor enough to even gain a fair trial, and there may be more in it than is thought; it would at least be interesting to hear from any others who may have given the weighing system a trial.

TO READERS.

Readers of THE CANADA LUMBERMAN are invited to send us contributions upon any subject relating to the lumber trade in which they may feel an especial interest or which they may desire to discuss. All letters of a sincere character will be published. Contributions for the October number should reach our office by September 20th.

HOW TO KEEP A FILE CLEAN.

Knowing how to keep a file clean is one of the fine points about filing. A great many filers, and probably nearly all of them, have a piece of a card which is tacked on to a narrow piece of board. These cards are pieces of leather some two inches wide, with fine steel wires driven through them and the points bent over, and are made primarily to be used on machines for carding wool and cotton in factories. A much better thing than this is a narrow piece of commercial steel, about 1-16x ¾-inch, filed to a rather thin edge. This pushes whatever there is in the teeth of the file out absolutely, and there is no scratching to be done.

ASSOCIATION OF MANUFACTURERS OF WOODWORKING MACHINERY.

The Association of Manufacturers of Wood Working Machinery throughout the United States has a social organization, and at its last session it was determined to hold their next meeting in the House of Hoo-Hoo at the World's Fair. The meeting will take place early in October, and it is expected to be well attended by the members of this important branch of the machinery industry. The officers of the organization are now making arrangements for the meeting, which will doubtless be a most successful gathering. Mr. H. E. Erwin, New Britain, Conn., is the secretary of the organization.

THE NEWS

ONTARIO.

—Robert Hower, of Port Arthur, Ont., has just completed extensive alterations to his planing mill.

—James Ingram had his arm broken in McCaffrey's saw mill at Stittsville, Ont., by being caught in a belt.

—Mr. J. J. White has recently sold his planning mill at Wheatley, Ont., to Mr. Ivison, who will continue the business.

—The saw mill property of William Caldwell at Carleton place, Ont., has gone out of Mr. Caldwell's hands, Robert Patterson having purchased it as an investment.

—Two of the largest lumber cargoes that ever passed through the Welland canal were carried down by the barges Viking and Vineland during the latter part of July.

—A by-law was carried at Cornwall on August 7th to loan J. B. Atchison $17,500, without interest, for twenty years to assist in rebuilding his saw mills and sash and door factory.

—A serious accident happened last month at the Preston-Bell mill at Fort Francis, a young Frenchman by the name of F. Ducet losing his life by falling from the log deck into the water below.

—A disastrous boiler explosion occurred in Smith's saw mill at Langton, Ont., on August 11th, resulting in the death of Isaac Leworge and Norman Wingrove and serious injuries to John Leworge. The building was completly wrecked, fragments being thrown a great distance.

—The St. Catharines Wood & Lumber Company, Limited, recently incorporated at St. Catharines Ont., with a capital of $40,000, is composed of W. H. McCordick, Frank C. McCordick, and C. B. Barson, of St. Catharines, H. J. Nicholls, of Huntsville, and E. O. Babcock, of Niagara Falls, N. Y.

—The largest raft that ever came into the St. Clair river within the memory of local lumbermen was brought to Sarnia recently from the Georgian Bay by the Reid Wrecking & Towing Company's tug "Ottawa." It consisted of 7,000,000 feet of logs and was consigned to the Cleveland Sarnia Saw Mills Company.

—The Keewatin Lumber Company, of Keewatin, Ont., manufactured 15,000,000 feet of lumber last year, nearly all of which was marketed in Manitoba. They are building a tie mill 1½ miles east of their present property. It is to have a capacity of 4,000 ties in 10 hours, and will cost in the neighbourhood of $25,000.

—The William Beatty Company, Limited, has been incorporated, with a share capital of $60,000, to carry on a general lumber business at Parry Sound, Ont. The incorporators are W. J. B. Beatty, Isabel Eliza Beatty, Frances Isabel Margaret Beatty, and Annie Georgina Bowes Beatty, all of Parry Sound, and John D. Beatty, of Sarnia.

—A number of American capitalists interested in the power development at Rainy River, Ontario, visited that town recently. The party included Thomas H. Shevlin, E. W. Backus, W. F. Brooks, E. L. Carpenter, H. C. Clark, F. M. Prince, Count Kalhoff, and others, of Minneapolis; J. Swift and J. B. Kilburn, of Chicago; Walter Douglas, of Cedar Rapids, and F. P. Nicon and F. C. Chamberlain, of Lacrosse. The object of their visit was to consider the best means of developing the water power of the Rainy river with a view to establishing pulp mills and other industries in addition to the extensive saw mill which they now have in operation.

—The Northern Land and Lumber Company, of Port Arthur, Ont., have just completed their new planing mill and dry kiln. The company, which was only organized in April of last year, is experiencing very prosperous times and is now the largest handler of yellow pine in the Dominion, their shipments locally and to Manitoba amounting to 1,500,000 feet. They are especially fortunate in having such a good point as Port Arthur to trade from, as they are able to bring in the lumber in its rough state from Wisconsin free of duty, tow it across Lake Superior and manufacture so cheaply as to enable them to successfully compete with any competition from the States.

THE EASTERN PROVINCES.

—W. W. Shaw is rebuilding his saw mill at Hartland, N.B.

—The Gaspe Lumber Company, of Gaspe, have just installed a powerful new boiler in their saw mill.

—The Dalhousie Lumber Company are building a third mill at Dalhousie, N. B. It is located on the lower islands.

—The Dominion Tar & Chemical Company have under consideration the erection of an extensive plant at Sydney, N. S., for the creosoting of timber.

—The Comstock saw and planing mill at Stanstead was completely destroyed by fire on August 6th. The loss is estimated in the neighborhood of $5,000.

—Wilfrid Ratti, convicted of stealing logs from B. A. Scott, of Roberval, Que., has been commited to stand his trial at the next session of the Criminal Court at Chicoutimi.

—The lumber exports from Newfoundland this season promise to be greater than any previous year. The Timber Estates, Limited, have contracts to ship 12,000,000 feet to South America.

—The old saw mill of Gilmour & Hughson at Chelsea, Que., has been sold to J. Wilcox & Company, of Montreal. The mill will be demolished and with its removal an old landmark will disappear. It is eight years since the mill was operated.

—The Estate of the late James McLaren, of Buckingham, Que., purpose constructing a number of dams on the Upper Lievre river for the purpose of conserving the water supply so as to permit of the operation of their saw and pulp mills all the year round.

—The lumber business carried on by the late James MacLaren at East Templeton, Que., is to be wound up. Tenders for the purchase of the business as a going concern, including timber limits, mills, plant, etc., will be received by the executors up to September 12th.

The Caraquet Railway, which consists of 85 miles of track extending from Bathurst to Tracadie Mills, N.B., through a good farming and lumbering country, which has heretofore been owned by English bond-holders, has been purchased by a Toronto syndicate represented by Peter Ryan and T. P. Coffee.

—J. D. Scott, general manager of the Quebec and Lake St. John railway, has just returned to Quebec from an extensive trip to England, where he succeeded in securing financial assistance for the construction of the La Tuque branch of the Quebec and Lake St. John railway. This is of special interest of lumbermen, as the railway will open up a very valuable lumber country.

MANITOBA AND THE TERRITORIES.

—T. A. Burrows is building a planing mill at Grand View, Man.

—W. F. Lawrence has sold his lumber business at Maple Creek, N.W.T., to A. A. Menely.

The Macoun Hardware & Lumber Company have opened a lumber yard at Hitchcock, N.W.T.

—The Alberta Lumber Company are preparing to build their saw mill on the old site at Cardston, N.W.T.

Charles Schack, lumber dealer, High River, N.W.T., has sold out to the High River Elevator & Lumber Company.

—The Rushton-Layton Lumber, Grain & Commission Company have opened a lumber yard at Stony Creek, N. W. T.

—Fleming & Son, foundrymen, of St. John, N.B., have dismantled the old Jewett saw mill at Millidgeville. Thus has passed one of the thriving industries of a few years ago, and one which was the chief means of livelihood for the people of the village.

—The Hanbury Manufacturing Company, of Brandon, Man., have been compelled to build another large addition to their factory for the manufacture of sash, doors and interior wood work. The company now employ 150 men in their factory and in logging operations.

—Paul Lea is making extensive improvements to his wood-working factory at Moncton, N.B. A new Corliss engine of 80 horse power has been installed and a new dry kiln built, in which the McEachren system as furnished by Sheldon & Sheldon, of Galt, Ont., will be used.

G. M. Annable, of Moose Jaw, N.W.T., has organized a company to carry on lumbering operations at Violin Lake, south of Rossland, B.C., where 5,000 acres of timber limits have been acquired. It is proposed to market the lumber in the North-West Territories. The capital of the company is $50,000.

CRAIG MINE CRYSTAL CORUNDUM WHEELS

Our Pure Crystal Corundum Saw Gummers have no equal for their rapid, cool, cutting properties.

Read the following from Bulletin 180 of the United States Geological Survey, which says:

"Often a distinction is made between emery and corundum, many persons not recognizing emery as a variety of corundum.

Emery is a mechanical admixture of corundum and magnetite or hematite. It is, of course, the presence of corundum in the emery that gives to it its abrasive qualities and makes it of commercial value, and the abrasive efficiency of emeries varies according to the percentage of corundum they contain."

Emery is imported, mined by Greeks and Turks and contains only about 25% corundum. Our Crystal Corundum is guaranteed to be 98% pure alumina, a Canadian product, mined and manufactured by Canadians for Canadians.

HART CORUNDUM WHEEL COMPANY, Limited, Hamilton, Ont., Can.

BRITISH COLUMBIA.

—The Ontario & Slocan Lumber Company ship the entire output of their shingle mill at Slocan City to Ontario.

—G. M. Thrift, owner of the new Hazelmere Lumber Mill, reports good business since commencment of operations in the month of May.

—A Cotton, shingle manufacturer, False Creek, Vancouver, is marketing considerable stocks in eastern points and the New England States.

—The Abbotsford Lumber Company, of Abbotsford, are doing a pretty extensive business in the Territories and Manitoba in heavy bridge timbers.

—The Chilliwack Shingle Manufacturing Company are seriously contemplating erecting a large saw mill and going into the manufacture of clear cedar.

—W. H. Higgins,of Vancouver,B. C., has purchased the right to 150,000,000 feet of standing timber on Humphrey Channel, ninety miles north of Vancouver, where he purposes opening up a number of camps.

—J. Johnson, inventor of the Johnson shingle machine, which is specially adapted for B.C. timbers, continues to successfully operate the shingle mill of the Brunette Saw Mill Company at New Westminster.

—The U. S. Government keep nineteen officials at Sumas, on the International Boundary, and any British Columbian trying to transport a load of lumber across the International line free of duty can only hope to do so by the aid of tunneling.

—Henry Schaake, of the Schaake Machine Works, New Westminster, reports very large sales of saw mill machinery and equipment throughout the province. This is the only firm in British Columbia manufacturing an entire equipment of saw mill machinery.

—The construction of the mills of the Rat Portage Lumber Company at Harrison River has been completed. However, the company in view of the present condition of the lumber industry, purpose delaying the installation of the machinery until such times as the trade shall demand it.

—A forest fire which raged in the vicinity of the Big Eddy saw mill of the Revelstoke Lumber Company at Revelstoke, assumed such large proportions that the operation of the mill was stopped and the assistance of the citizens of Revelstoke called in. The fire was successfully checked.

—The Monarch Lumber Company, which recently acquired the Ross-MacLaren saw mill on the Fraser river, at New Westminster, B.C., will, according to report, commence operations as soon as some improvements to the plant are completed. The company will employ upwards of 200 men.

—The Canadian Pacific Lumber Company at Barnet, near Vancouver, are pushing rapidly ahead with the construction of their new mill which is being erected in place of the one lately comsumed by fire. In their planing mill, which also was consumed, they had the misfortune to loose a planer which would accomplish the remarkable feat of dressing timber 24 inches square.

The Victoria Lumber & Manufacturing Company, of Chemainus, Vancouver Island, in view of the continued depression in the foreign markets, have lately been turning their attention to developing a trade in Manitoba and the Territories, their efforts being attended with considerable success.

—A wealthy eastern syndicate headed by a Mr. Cook, who has large mills in Algoma, Ont., is negotiating for the purchase of 17,000 acres of timber land from the Nelson and Fort Sheppard Railway Company, with the idea of establishing a large saw mill industry in the neighborhood of Ymir, B. C.

—The operations of the Canadian Timber & Saw Mills, Limited, of Trout Lake, have been attended with considerable success since commencement in June, under the improved market conditions of Manitoba and the Territories. The daily output is 60,000 feet of lumber,mostly cedar, 80,000 shingles,and 25,000 laths.

—The East Kootenay Lumber Company, Cranbrook, B.C., are doing a tremendous business in the manufacture of ties for railroad purposes. It is believed they are among the largest tie manufacturers in the Dominion, their shipments last year amounting to the enormous figure of 1,000,000 ties to the C.P.R. alone, it taking 250 train loads to transport the product from the mills to their destination.

—The B. C. Mills, Timber & Trading Company, of Vancouver, B. C., had a very creditable exhibit at the Winnipeg Fair, consisting of five ready-made houses. Numerous orders are coming in to the company's offices both at Winnipeg and Vancouver for these up-to-date dwellings, which are shipped in their parts and soon after arrival put together, presenting the appearance of first-class dwellings houses. Prices are moderate and within the reach of all settlers.

—The CANADA LUMBERMAN directs the attention of its readers from coast to coast to the splendid list of advertisements which are now appearing in both our weekly and monthly numbers from British Columbia lumber and shingle manufacturers. The strong headway made by British Columbia lumber products in the various markets of Manitoba and the Territories and even the East, in face of heavy freight rates, is, we believe, greatly due to the judicious expenditure of money for advertising purposes and also to the conducting of energetic canvassing of prospective buyers throughout the country.

A MILLION POUNDS OF GRATES.

It is said that the Gordon Hollow Blast Grate Company, of Greenville, Michigan, who claim to be the largest manufacturers of blast grates, edgers and trimmers in the world, sell a million pounds of Gordon hollow blast grates and their connections annually.

A singular fact in connection with this is that, in spite of the vast number of these grates in use, some of them having been installed early in the nineties, only about 5 per cent. of their annual output is for repairs, the grate being so durable that very few customers ever have occasion to renew any portion of the apparatus.

WELL PLEASED WITH THE LUMBERMAN.

Mr. Joseph Innes, mill superintendent Chilliwack (B.C.) Shingle Company, writes: "I am well pleased with THE LUMBERMAN, and have passed many happy hours reading its pages."

PERSONAL.

Mr. J. M. Agnew, secretary-treasurer of the North Star Lumber Company, Cranbrook, B.C., was in the East on a business trip last month.

Mr. George McCormick, of the Kamloops Lumber Company, has just lately returned from a trip embracing Toronto, Montreal, and Ottawa.

Mr. Alexander McDougal, who is engaged in the lumber business at Fernie, B.C , was married at Arnprior, Ont., a few weeks ago to Miss Harvey.

Mr. H. Cameron, manager of the Moyie Lumber Company, Moyie, B.C., has lately joined the ranks of the benedicts. The CANADA LUMBERMAN extends congratulations.

Mr. E. B. Eddy, president of the E. B. Eddy Company, paper manufacturers, Hull, Que., received many congratulations upon the occasion of his seventy-eighth birthday on August 22nd last.

The death occurred recently at Jacquet River, N.B., of James P. Doyle, one of the oldest residents of that neighborhood. Mr. Doyle was in early life engaged in the lumber business and was well known by all the old New Brunswick manufacturers.

The Rainy River Lumber Company have just opened offices at 13 Bank of Hamilton Building, Winnipeg, where Mr. J. L. Spencer will take up the position of sales manager. Mr. Spencer has been for some years with the Cookston Lumber Company and leaves his post with that company to locate in Winnipeg.

Lady Joly de Lotbiniere, wife of Sir Henri Joly de Lotbiniere, lieutenant-governor of British Columbia, died in Victoria on August 16th, from the effects of a paralytic stroke, sustained some weeks ago. Her death is deeply regretted throughout the entire Dominion, for she was widely known and most highly esteemed. She was always a true helpmate to her husband in the many positions of responsibility and honor which he has occupied, and her wise counsel will be greatly missed.

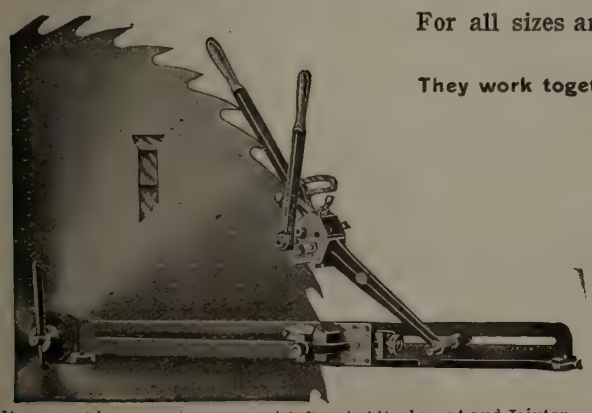
Referring to the fact that the Dominion Exposition is being held at Winnipeg this year, and that last year Toronto was the point chosen, the Maritime Merchant points out that next year's Exhibition should justly be held in the Maritime Provinces. It is absolutely essential that the people of the different provinces should become acquainted with the possibilities of each province and as a means to this end a Dominion Exhibition should be held in the Maritime Provinces.

A company has been organized in the city of Mexico under the title of the Mexican Permanent Exposition Company for the purpose of maintaining a permanent exhibit in that city of such products of other countries as are best adapted to Mexican cultivation and uses. They have already secured a government concession, and are erecting extensive buildings which are to be opened in the latter part of October. J. Landero Y. Cos is president and E. Hegwisch secretary.

THE HANCHETT SAW SWAGE AND SWAGE SHAPERS

For all sizes and kinds of Saws, Circulars, Bands, Band Resaw, and Gang Saw.

They work together. They give the saw teeth proper clearance.



Hanchett Circular Saw Swage with Bench Attachment and Jointer.

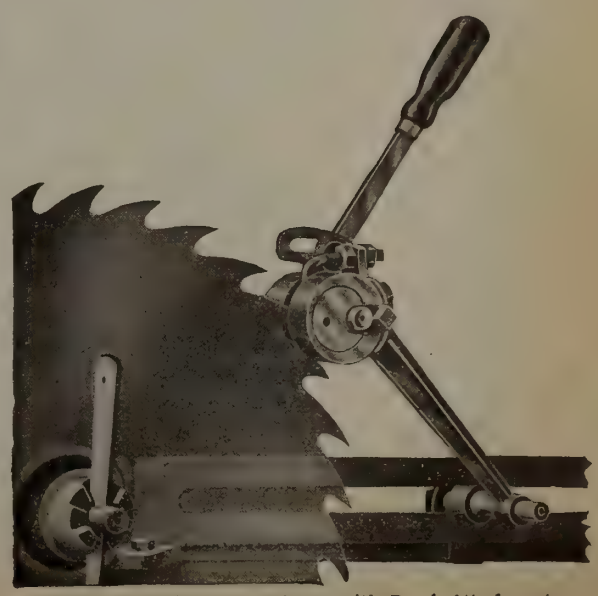
After the saw has been swaged remove the saw swage from the pin and place the Shaper thereon.

The adjustment is made from the point of the tooth, hence every tooth is made exactly alike—widest at extreme points, widest on face, no matter what the irregularity of spacing, pitch, etc. We are always glad to send our machines out on approval guaranteed to please, if not satisfactory return at our expense. A trial will cost you nothing.

Write for circular "F" to

Hanchett Swage Works, Big Rapids, Mich., U.S.A.

Hanchett Saws do Good Work.



Hanchett Circular Swage Shaper with Bench Attachment.

MANUFACTURE OF TRIANGULAR TIES.

Mr. M. Macauley, of Portland, Oregon, describes in the Columbia River and Oregon Timberman the manufacture of triangular railway ties as practised by the John O'Brien Lumber Company, of Somers, Mont. This company is located in a large belt of timber, principally tamarac, well adapted for the manufacture of railroad ties. This timber is tributary to the Whitefish, Stillwater and Flathead rivers.

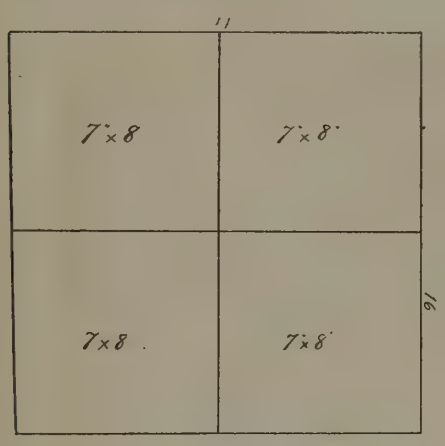
President Hill, of the Great Northern Railroad, who is interested in the company, while in Austria several years ago, became inbued with the advantages of the triangular tie over the square tie, and has been using a considerable number of these ties for several years in his system.

The mill differs but little from the ordinary sawmill, the only difference being that in order to produce triangular ties the square timber is transferred to beveiled rolls and re-sawed.

ADVANTAGES CLAIMED.—The triangular tie requires less timber to serve the same purpose as the ordinary square tie.

The ease with which the tie accommodates itself to the roadbed by reason of its V, or wedge-shaped, form, making it practically a self-tamping tie, at the same time offering a surface bearing on the rail equal to the square tie.

It is contended that the triangular tie is more durable and less liable to rot in the track

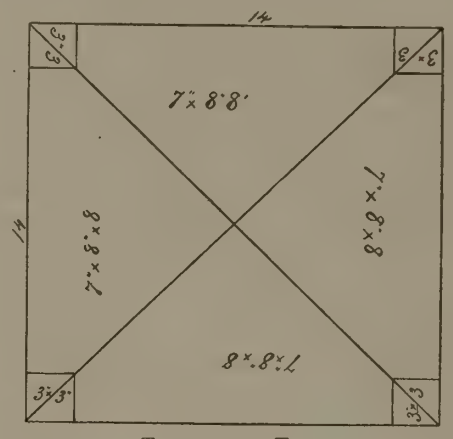


ORDINARY SQUARE TIE.

than the square tie, by reason of its form providing a natural watershed for the portion embedded in the track. This is obvious, there being a face of only three inches on each side before the acute angle of the tie is reached. On the square tie the water follows down the sides and lodges at the base, and every impact has a tendency to soften the ballast directly under the tie, and work loose the tamping, which is very noticeable at the extreme end of the ties, especially in the case of poor or soft ballasting.

DISADVANTAGES.—The triangular ties does not serve the purpose of the square tie, and from what I shall endeavor to show, are manufactured at a loss of timber, costing one-fourth more than the square tie.

To produce eight square ties 7"x8"x8 feet, it requires a timber 14"x16"x16 feet. To manufacture eight triangular ties 7"x8"x8 feet it requires a timber 14"x14"x16 feet, after making



TRIANGULAR TIE.

allowance for saw kerf. A timber 14"x16"x16 feet containing 298 2-3 feet, makes eight square ties 7"x8"x8 feet, 37 1-3 feet each, equal to 2982-3 feet. It is obvious there is no loss. To manufacture eight triangular ties 7"x8"x8 feet it requires a timber 14"x14"x16 feet, containing 261 1-3 feet, a gain in manufacturing triangular ties of 37 1-3 feet.

But while this gain appears, there is a loss of 48 feet in manufacturing eight triangular ties out of 14"x14"x16 feet timber. In order to give the ties an 8-inch face the timber loses four pieces 3"x3"x16 feet cut triangular, and instead of 32 2-3 feet in each triangular tie, there is but 26 2-3 feet, or a loss of 6 feet per tie.

Figuring this loss of 6 feet on the daily output of 1000 ties it means a loss of 6,000 feet of lumber. Computing the cost of 6,000 feet of lumber at $7.00 per 1000 feet, means $42.00 per day, or 4 1-5 cents additional to the cost of every triangular tie manufactured.

It is admitted, however, that the 3x3 edging cut triangular, as shown by the diagram, could be utilized in the manufacture of quarter-round moulding, but even this saving would not make up for the loss of six feet per tie as indicated above.

In this connection it may be stated that the size of logs from which the triangular ties are cut make practically only four ties each, the lumber on the outside being clear makes it available for moulding stock.

In the square tie 7"x8"x8 feet there is 37 1-3 feet, in the triangular tie there is 26 2-3 feet, a difference of 10 2-3 feet. It cannot be expected that the 7"x8"x8 feet triangular tie can serve the purpose of the square tie for solidity and safe-giving qualities.

The triangular tie splits more readily than the ordinary square tie, owning to the small body of timber available to receive the spike.

In laying the ties in a new piece of track their pyramidical form precludes their use without first ballasting to some extent, as the impact of the rolling stock on the rail has a tendency to cause ties to deflect from the perpendicular.

Before using the ties they are treated in the tie preserving plant, constructed adjacent to the mill, with a solution of zinc and glue, a treatment which it is claimed preserves the life of a tie from five to fifteen years.

After three years' experiment it may be of interest to note that the use of triangular ties fails to demonstrate any merit that would warrant their universal adoption.

SUPERIORITY OF B. C. SHINGLES.

That the British Columbia manufacturers produce a better shingle than the Washington mills, is admitted by the Pacific Coast Lumber Trade Journal, in which we find the following: "Without going into the merits of the controversy that has been raging at Olympia and other places in this state relative to the employment of Japanese shingle weavers, it can be truthfully stated that the Japanese crews employed in the British Columbia mills turn out a better grade of shingles than the white labor employed on this side of the line. The trouble with the latter is that there are too many individuals in the ranks of the white shingle weavers who labor by the sweat of their jaws and not their brow, and the result is that they will not do decent work. This is emphasized by recent strikes on Grays Harbor and in Skagit county, where the crews walked out in a body because the foremen insisted on better packing. It is no secret that the millmen have lost considerable business this year because of the loose and careless work done by the shingle weavers, and when prices are forced down by lack of demand due to slovenly methods of the packers and knotsawyers and wages are reduced because of it, the jawsmiths refuse to work or to allow others to labor also."

THE BIGGEST SPRUCE TREE.

It has been found again—that is, the biggest spruce tree on the coast. This time it is the real thing. No wonder it has grown to wondrous size, for it was found in God's valley, twelve miles from Nehalem, in Oregon. It is 21 feet in diameter, hence 63 feet in girth. It will have to be chopped down to count its rings to ascertain its age. It will now be in order to estimate how many feet of car siding could be made from it; how many butter firkins; how many apple boxes and how much sawdust would be wasted with a circular saw over a band saw.—West Coast Lumberman.

PULP NOTES.

Sir Alfred Harmsworth and a number of newspaper proprietors of London, England, are reported to have just closed negotiations for 1,500 square miles of timber limits in the interior of Newfoundland, on which they propose to erect an immense pulp mill.

It is reported that the industries contemplated by the Quatsino Power & Pulp Company at Quatsino Sound, B. C., are to be proceeded with under a contract that provides for the operation of the plant within one year. The plans call for a pulp mill of 125 tons capacity daily, and it is intended as soon as business warrants to build a paper mill to manufacture the pulp into paper.

A boiler explosion occurred in the Kinleith Paper Company's mill at St. Catharines, Ont., on August 13th, by which the building was badly wrecked. The exploding boiler was one of the rotary rag boilers situated on the second floor of a three storey stone section of the mill. Another similar boiler was carried out into the old canal, together with all the other machinery and debris. The rag boilers were generally operated at a pressure of 25 and 30 pounds. They were fed by pipes from a large steam boiler in another part of the establishment which carries a pressure of 125 pounds, and it is the impression that the regulator must have failed to work and allowed the low pressure boilers to receive the full 125 pounds

It is again reported that English capitalists will build a pulp mill on the Gilmour & Hughson water power at Chelsea, Que.

GUESTS OF THE HANBURY COMPANY.

The Hanbury Manufacturing Company, of Brandon, Man., entertained about one hundred of their friends, many of whom were members of the Western Retail Lumbermen's Association, during the Western Manitoba Fair held in that town August 9 to 12. As the guests of the Hanbury Company, they were courteously cared for at the Empire Hotel, which is one of the finest in the Canadian North-West. On the morning of the 10th they were entertained at the factory of the company and in the afternoon were taken to the fair grounds by a special train, where their red badges secured them free admission to everything of interest. The following forenoon they were taken to the Brandon Experimental Farm and Indian School, being afterwards delivered at the saw mills of the Hanbury Manufacturing Company, where they saw a complete lumber manufacturing plant in operation. In the afternoon they were again taken to the Fair grounds by a special train, where they witnessed the races of the winners at the Dominion Fair at Winnipeg.

The occasion was one of much enjoyment, and all expressed their gratitude to Mr. Hanbury for his kindness and hospitality. The saw mills of the Hanbury Manufacturing Company at Brandon, Man , and Cranbrook, B. C., will manufacture about 25,000,000 feet of lumber this year.

THE DISTINGUISHING MARK

To install in your mill a set of saws that will suit you in every particular, it is necessary that you be familiar with some means of distinguishing the HIGH-CLASS SAWS from the others. Knowing some such mark you wil always discriminate in favor of the saw which bears that mark of QUALITY.

THE ATKINS "TRIPLE A" etched on all HIGH GRADE SILVER STEEL CIRCULAR and BAND SAWS, is the sign which assures QUALITY, EXCELLENCY and absolute SUPERIORITY in Saws. "IF IT'S SILVER STEEL IT'S AN ATKINS." Look for our trade mark.

A little reminder of the "TRIPLE A" in the way of a pretty watch charm to Mill men who write for it. Also our Mill Supply Catalogue. Both free.

The A. J. Burton Saw Co., Limited, Vancouver, B.C.

INCORPORATED 1904

AUTHORIZED CAPITAL, $75,000, IN 750 SHARES OF $100 EACH

A. J. BURTON, Managing Director.
HERBERT WILKINSON, Secretary-Treasurer.

BOARD OF DIRECTORS: ROBERT JARDINE, President; DR. E. SAWYER, Vice-President; E. W. McLEAN, HENRY PIM, A. J. BURTON.

BANKERS, Molsons Bank, Vancouver, B.C.: OFFICE AND WORKS, Corner of Powell Street and McLean Drive, Vancouver, B.C.

The company is offering stock to the public at par.

The company has purchased land, consisting of four lots, upon the corner of McLean Drive and Powell Street, Vancouver, B.C., facing Powell Street, and running back to the C.P.R. track, and with one side upon McLean Drive, (now opened up). The whole measuring 185 ft. by 132 ft.

Upon this a building has been erected, 85 ft. by 40 ft., two floors, with a tempering shop 26 ft. by 32 ft. one floor at one side.

A 50 h.p. motor and the main shafting and pulleys are already installed. A portion of the machinery has been ordered, including a milling machine for the inserted-teeth saws, a heavy parallel grinder for band saws, and the material for the tempering furnace.

The company is having its circular saw grinding machine built after the latest improved American model.

The stock already sold is more than sufficient to cover the cost of the land, buildings and the machinery and supplies now in hand and ordered.

Further stock is now offered for purchasing the further necessary plant and supplies, to complete the whole, and enable the company to execute the orders which are already promised to the company.

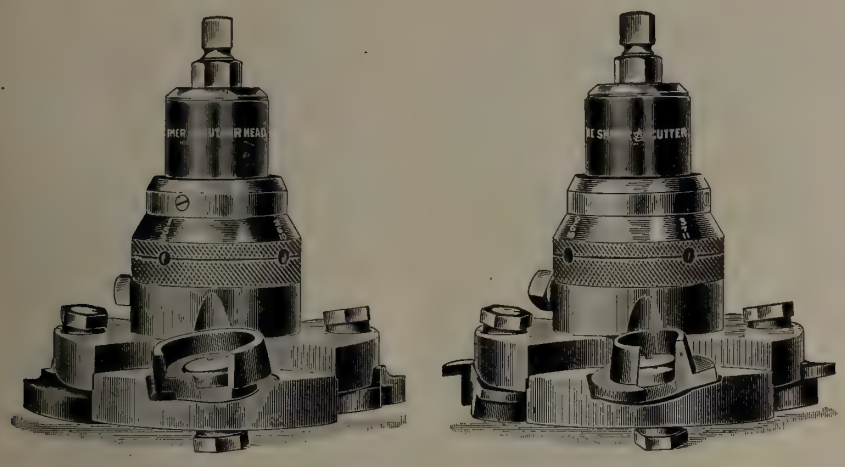
The inquiries already received from users of the company's manufactures ensures that the works will be fully occupied in executing orders, and sufficient land is owned by the company for extending the works when the needs demand it.

The company enjoys the advantages of cheaper fuel for the tempering furnaces, and oil for hardening, than can be obtained in Eastern Canada, and Messrs. Jessop, of Sheffield, have quoted the company the same prices for their steel delivered at Vancouver as at Toronto.

Applications for shares will be received by the Secretary, HERBERT WILKINSON, at the company's offices, corner Powell Street and McLean Drive, Vancouver, British Columbia.

The Shimer Cutter Heads

WITH EXPANSION

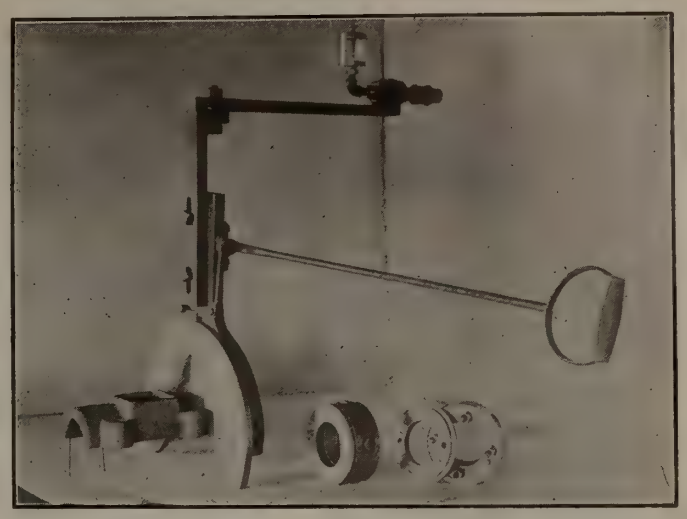


Are built from forgings of Steel and finished throughout in the solid metal. This insures accuracy, durability and perfect mechanical adjustments.

They are appreciated by the user because they hold up under the severest tests. They cut easily all kinds of hard, knotty and cross-grained lumber. If you make single tongue and groove Flooring, Ceiling and Wainscoting, buy THE SHIMER CUTTER HEADS and you will have no disappointment. Address

SAMUEL J. SHIMER & SONS

Milton, Pennsylvania



"KILLAM'S TANDEM CIRCULAR SAW MILL"

The attention of Manufacturers of Lumber is called to the above named latest and best method of sawing lumber.

The following advantages are obtained:

Lower cost of installation than any other method which will saw an equal number of superficial feet in a given length of time.

Smaller expense in operation, thus producing lumber at a lower cost per thousand feet than any other method.

Requires no more help to operate it than any well equipped Circular Saw Mill.

Lumber has been sawn better and more accurately cut by this method than by any other now in use.

The Killam Tandem Circular Mill requires no more skilled men to operate it than is required to operate the ordinary Circular Mill.

If solid saws are used, the larger one, when worn down can be used for the smaller one, thus saving expense for saws.

No difficulties in handling or setting by this machine and no delays.

No time is lost in setting for any thickness from the cut of stationary saw up to six inches.

This machine takes the place of a resaw in a mill and only requires a floor space of 6 ft. x 6 ft.

Also takes the place of a Twin Circular Mill that is now used for slabbing, and this machine will side as much lumber as any Twin Circular, thus saving the expense of a resaw and men to operate the same.

This machine is so cheap that any manufacturer of lumber can well afford to have one, for it will pay for itself in a short time.

Will cut 50 per cent. more lumber than the Circular Mills now in use.

MANUFACTURED BY OXFORD FOUNDRY & MACHINE COMPANY, OXFORD, N. S.

REFERENCE.

M. L. KILLAM, TRURO, N. S.

Dear Sir.—It gives us great pleasure to testify to the value of your Tandem Circular Saw Mill. It has paid for itself twice over during the six months we have run it. It requires no more help to operate it and the lumber is more evenly sawn. It does all that you claim it will and we would recommend it to any manufacturer who wishes to make more and better lumber with the same help as with the Single Circular Mill. Wishing you success, we are Yours very truly,

Dec. 31, 1903. DICKIE & McGRATH, Tusket, N. S.

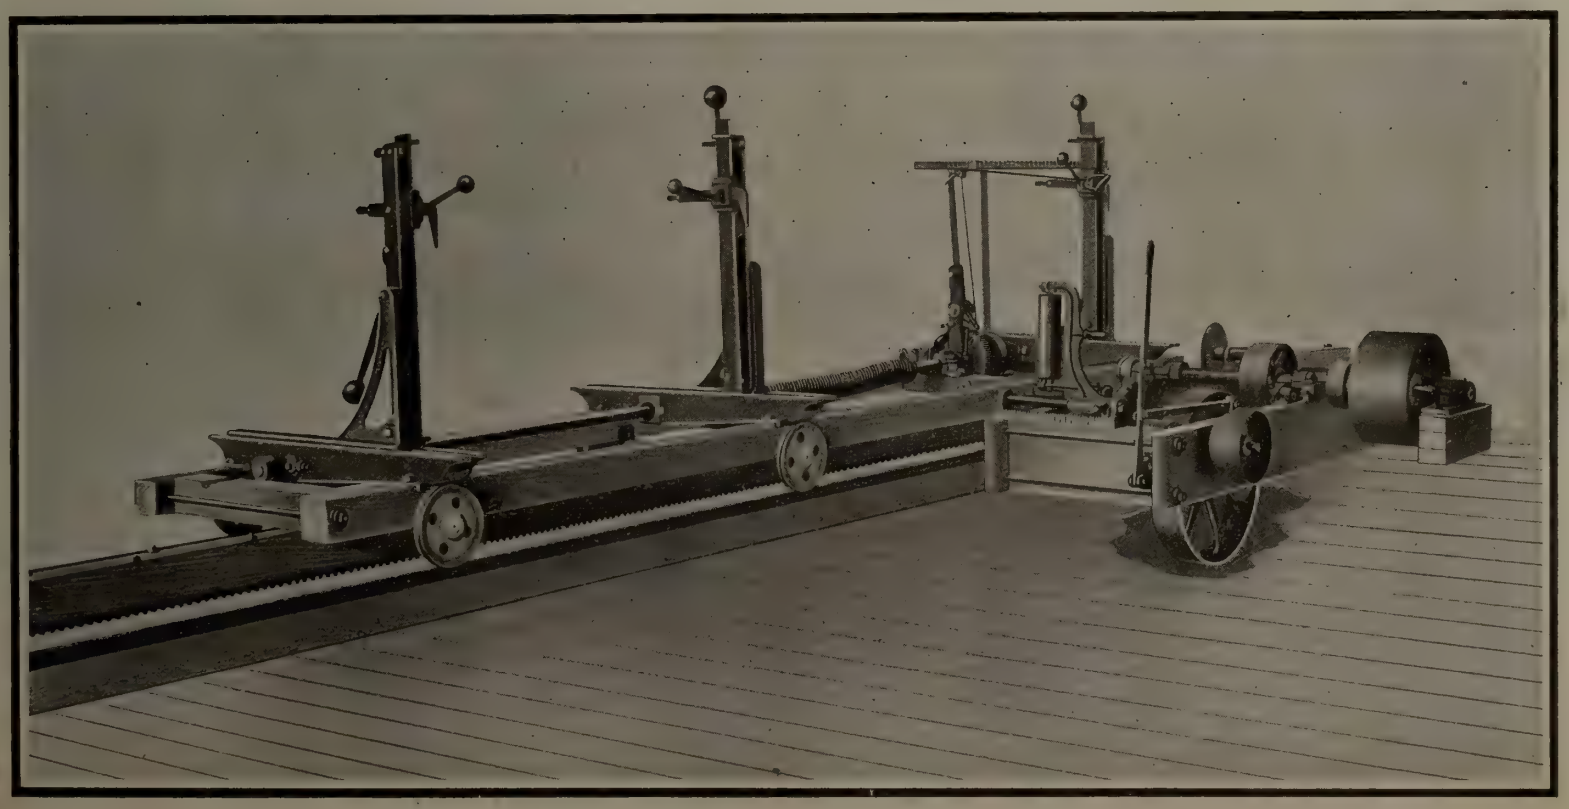
THE E. LONG MANUFACTURING COMPANY

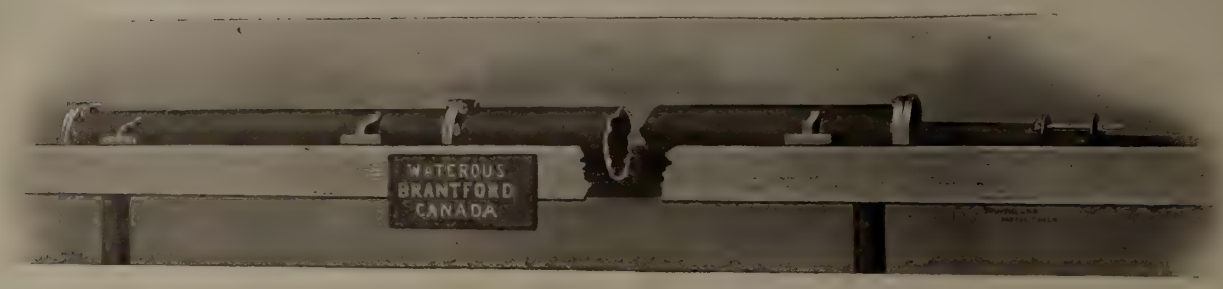
ORILLIA, ONTARIO, CANADA



The above cut represents our new No. o Sawmill, capacity 5,000 to 8,000 ft. per day, to carry up to a 56″ saw.

DON'T WASTE TIME

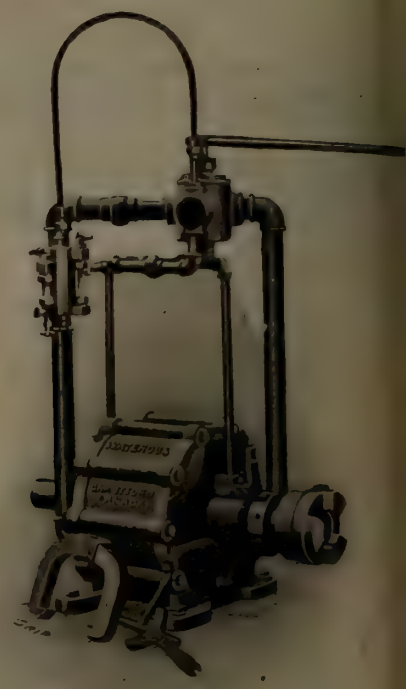
This is most essential in the operation of your mill and a reliable FEED will help towards this end fully more than any other mechanism about it. . .



DIRECT ACTING STEAM FEED

Standard sizes 7", 7½", 8", 9", 10", 11" and 12".
Cylinders in six foot lengths.

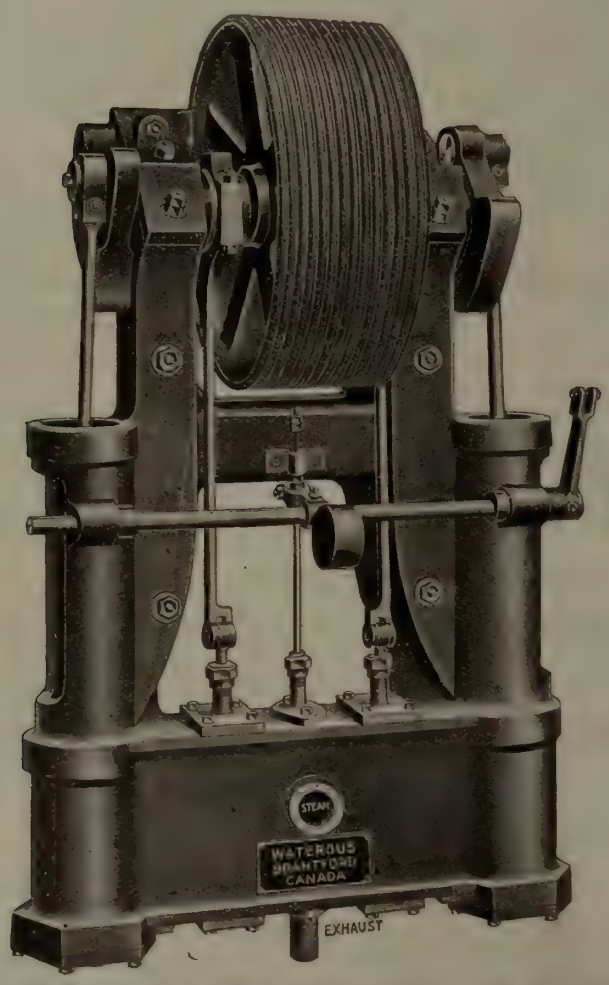
These FEEDS are provided with our latest PATENT VALVES—the best in valve construction, works easily and certainly.



THE SOULE ROTARY STEAM FEED

A splendid Feed for small mills—small and compa
therefore takes up little room and readily installed, a s
means of increasing the capacity of your mill, and m
in the following sizes :

No. 1 Feed has 1½" pipe, suitable for 10,000 capacity.
No. 2 Feed has 1½" pipe, suitable for 20,000 capacity.
No. 3 Feed has 2" pipe, suitable for 30,000 capacity.
No. 3 Feed has 2½" pipe, suitable for 40,000 capacity.



THE BECK PATENT DUPLEX ENGINE FEED

is not surpassed by any other similar Feed that is made, easy to handle, easy on steam, no leaky joints, no trunnions to wear. We furnish these FEEDS complete with two sheaves, all fittings and castings for attaching ropes to carriages. The Beck Feed stands for Capacity, Reliability and Economy.

THE CUNNINGHAM OSCILLATING TWIN ENGINE FEED

is so well known that it needs no special mention.

Write Us for Prices on these Feeds

And We Will Gladly Furnish Prices and Estimates on Machines for Saw Mills, Pulp Mills, Steam Plants, Boilers, Engines, Etc.

THE TRIUMPH TURBINE

Is the most powerful wheel on the market to-day. A glance at this cut of the centre shows that the buckets are designed to secure the **maximum** of **speed** with **great power** and a **free discharge.** Mr. E. S. Edmondson, of Oshawa, writes as follows under date of November 16th, 1903, regarding a 26 inch Vertical Triumph Wheel:

> "The Wheel is strictly first-class in every particular, and after a careful and thorough test I am prepared to say that I believe it is the best wheel in the market for Electrical purposes. It has high speed, large power, high efficiency at part gate, and has practically no leakage. I am more than pleased with the thorough and workmanlike setting you gave me throughout."

For horizontal settings in large Pulp Mills, Cement Mills or Electric Power Developments this Wheel has no equal. We invite your enquiries. Large catalogue to be had for the asking.

We are always glad to submit estimates and prices on **Improved Vulcan and Leffel Turbines, Improved Lane Circular Saw Mills, Edgers, Trimmers, Slashers, Shingle Machines, Lath Machines** and all machinery of this kind.

SAW MILL MACHINERY

Saw mill men are fast finding out and appreciating the great saving effected by using Steam Setting Machines.

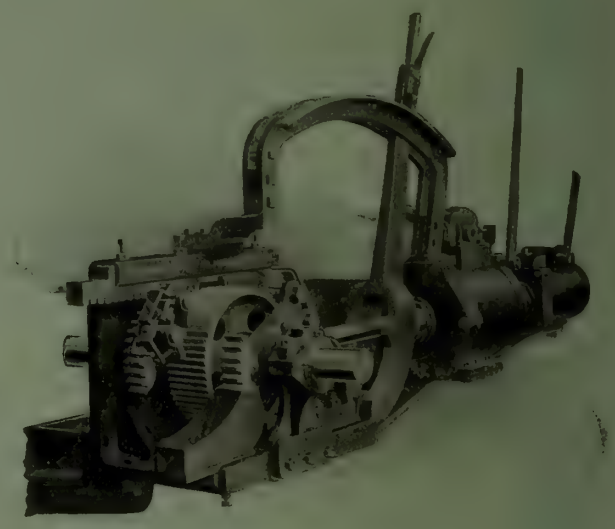
We have supplied these machines on trial on the understanding that they were to be returned to us if they did not give every result promised.

Not one of them has ever been returned.

Ask your setter if he could not do better work with one of these machines, then write us for prices and catalogues.

The standard size machine, as shown in cut, is well known to all mill men. Every one in operation is proving daily that you can cut more and better lumber with it.

When deciding on your improvements for next season you must take this machine into consideration.



This cut shows our Steam Set Works for the large blocks in use on the Pacific Coast. It is a very powerful machine, and will set for two-inch lumber as quickly and more easily than the hand lever now sets for one.

Our last illustration shows our

IMPROVED STEAM SETTER

WITH ENCLOSED RATCHET SET WORKS

This is an improved form of the standard machine. We consider it is the most reliable and efficient form of Steam Set Works that exists at the present time.

It will set four inches with one throw of the lever, and is just the thing for mill men sawing timber for export.

We are anxious to tell you more about any of these machines. Why not send for our catalogue ?

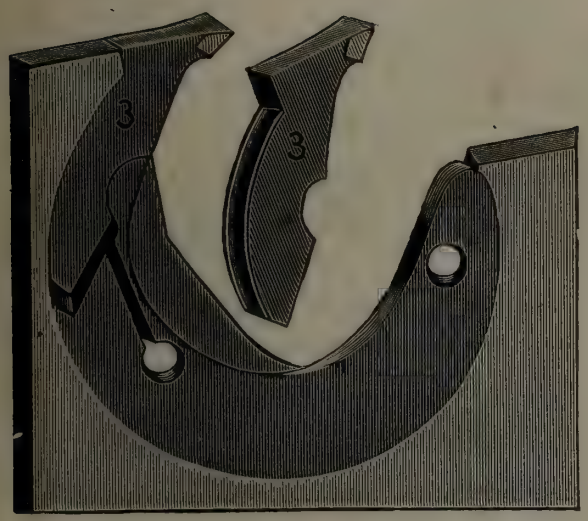
R. H. SMITH CO., LIMITED

St. Catharines, Ont.

We are the Sole Manufacturers of Saws under the **Simond's Process** in the Dominion of Canada.

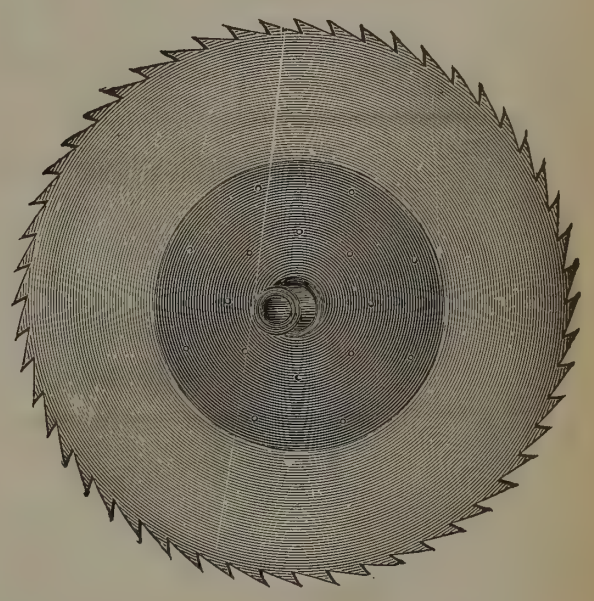
There is no process its equal for tempering circular saws. Other makers recognize this fact, as some of them, in order to sell their goods, claim to have the same process. **All such Claims are FALSE,** as the patentee in the U. S. and ourselves are the only firms in the world who use it.



INSERTED TOOTH SAWS

Notice the improved shank. We call particular attention to the swell which strengthens it at the weakest part and which gives it more wear than the old style.

Shanks made in usual gauges and to fit your saws perfectly.

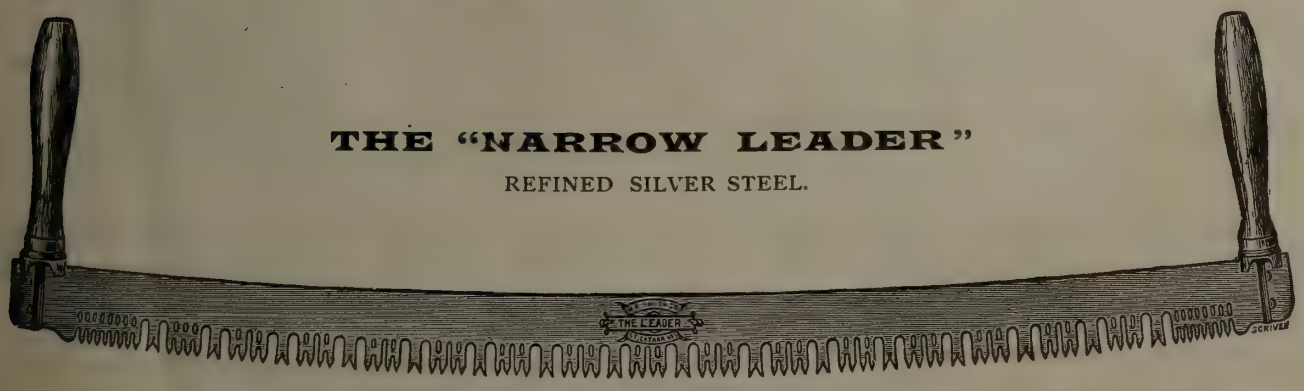


SHINGLE SAWS

The quality of the "Simonds" Shingle Saws is proven by the fact that the largest shingle and machine manufacturers in Canada are using them.

Run a "Simonds" and you will increase your output.

CROSS-CUT SAWS



The Simond's temper and style of tooth make the "Leader" the fastest and easiest cutting saw manufactured.

THE CANADA LUMBERMAN

VOLUME XXIV. NUMBER 9. } TORONTO AND MONTREAL, CANADA, OCTOBER, 1904 { TERMS, $1.00 PER YEAR Single Copies, 10 Cents

THE PIGEON RIVER LUMBER COMPANY.

The splendid illustrations shown herewith represent the properties of the Pigeon River Lumber Company, of Port Arthur, one of the most up-to-date saw mill establishments in the country. The company was organized in the year 1897 by a party of Wisconsin capitalists, Mr. D. J. Arpin being president, and Mr. William Scott secretary-treasurer. A splendid plant was erected as speedily as possible on a site of thirty acres right along the shores of Thunder Bay at the head of Lake Superior, and work was commenced in the early part of 1901, operations having been continued ever since with remarkable success. The site is all of the site near to King's grain elevator. It is a two-storey building 140 x 50 feet, equipped with two double cutting bands, resaw, heavy gang edger, slab slashers and trimmer. A lath mill and a shingle mill are attached, both being well equipped.

The boiler room is a large stone annex equipped with six boilers, four of them 16 x 72; two engines and an electric light plant. A machine shop and filing room are attached.

The planing mill is situated about two hundred yards further east. It is 300 x 75 feet in dimensions and is equipped with six planers, moulding machines and surfacer.

The capacity of the saw mill, lath and shingle mills are all given for a period of twenty hours, as they are run night and day, the figures being as follows: Saw mill, 250,000 feet; lath mill, 25,000; and shingle mill, 25,000. This vast output is all marketed in Manitoba and the Territories as far west as Regina, although the company are beginning to turn their attention to the eastern markets. Their specialty is white pine, which constitutes 90 per cent. of the output, red pine representing the balance.

Mr. William Scott, the secretary-treasurer, hails from Grand Rapids, Wisconsin, and has been directly connected with the lumber business since commencing work as a boy. He has entire charge of the mills, together with the selling and marketing of the stocks, and it is undoubtedly due to his ability and shrewdness of management that the company have been so successful in their operations. He is energetic, and possessing as he does the tact to obtain the best work from the company's employees, without losing their good will, it is not to be wondered at that the company find him indispensable for their successful continuation of operations.

During the past spring Mr. Scott has had the power plant of the saw mill increased by the addition of two new boilers and one engine.

SAW AND PLANING MILLS OF THE PIGEON RIVER LUMBER COMPANY, PORT ARTHUR, ONT.

that could be desired by the most exacting of mill owners, covering as it does the shore of the lake for a distance of several hundred yards, possessing a gradual slope towards the water and being favored by the most perfect transportation facilities both by water and rail. The main lines of the C.P.R. and C.N.R. run right through the company's property and afford splendid connections with the prairie markets. A little to the east is presented the local markets of the growing towns of Port Arthur and Fort William.

The company deal extensively in white pine, their supply being drawn from 40,000 acres of heavily timbered land in and around the Rainy River sections of both Ontario and Minnesota, all the logs cut being towed across the lake to the bay in front of the mill. Some idea will be gathered by the reader of the extent of the cut when it is known that on the day of the writer's visit the company had a boom on hand which the manager, Mr. Scott, estimated at fully ten million feet.

The saw mill is situated on the extreme west

SPRUCE AND BALSAM LATH AND SHINGLES.

In answer to a subscriber who asks our opinion as to the value of spruce and balsam for lath and shingles, we would say that spruce makes fairly good lath, and when large blocks that are sound and clear of knots, shakes or heart, good common shingles. Balsam will not make shingles for roofing, but shingles made from balsam might do very well for side walls if well painted to protect them from the weather. Balsam is not considered altogether satisfactory for lath, as it is likely to be shaky and slivery when dry and be liable to split and twist when nailed on the wall. It is, nevertheless, manufactured in limited quantities. For durability under mortar balsam is all right. There is no difference in the price of spruce and balsam lath, current quotations being $2 at the mill for 1½ inch No. 1, four feet in length.

EXTENSION OF PREFERENTIAL TARIFF.

The Governor-General has approved of an order in Council adding the Cape of Good Hope, Natal, Orange River, the Transvaal and Southern Rhodesia to the list of British colonies entitled to the benefits of the British preferential tariff in Canada, dating from 1st of July, instant. This is in return for the preference extended by the South African Customs Union Convention to Canada. Our exports to British Africa last year amounted to approximately $1,900,000.

FOREST FIRES IN BRITISH COLUMBIA.

Although very considerable damage has been done by fire to timber throught the province of British Calumbia, it is very difficult to arrive at the approximate loss, or the amount destroyed. Some of the timber was on government land, while some had been taken up. In the Kootenay district the largest known loser is the Elk Lumber and Manufacturing Company, of Fernie, composed of Minnesota people. In the fire of July 24th and 25th, two million feet of cut logs were burned, and the loss will be al-

FEL ING TREES—PIGEON RIVER LUMBER COMPANY.

together $200,000. The town of Fernie was also threatened. The East Kootenay Lumber Company lost 3,000 logs, and the C.P.R. 300 ties. The town of Creston had a narrow escape, and the flume at the Alice concetrator, in that vicinity, was destroyed. At Michel the fire was so close to the town that the people dug holes in their yards and buried their pos-

LOADING LOGS WITH STEAM LOADER—PIGEON RIVER LUMBER COMPANY.

sessions. The town of Morrissey also had a narrow escape. The Arrowhead Lumber Company's limits on Galena Bay were on fire, and T.J. Graham's camp had to move. Little damage was done, however, as a thunderstorm came along shortly afterward. The Big Eddy saw mills, near Revelstoke, had a scare, and a large number of citizens of the town turned out to assist in putting out a fire near by. The C. P. R. yard engine and a gang of men also were in the work. Mr. Gilpin's saw mill near Morrissey, purchased from the Cedar Valley Improvement Company, was destroyed, also a cottage containing the personal effects of Manager Grady, of the Morrissey Lumber Company.

The fires were bad in the vicinity of Fort Steele and Cranbrook, and raged on both sides of the railway track. Messrs. Blue & Deschamps and the China Creek Lumber Company at Rossland took the precaution of having rangers cruise the limits constantly, and three fires were caught in the initial stage and extinguished. In Cariboo, where railways are absent, there were few fires. On the coast, a very extensive fire raged near Sliamon for several weeks. Tht Hastings Mill has its camp F here, and the fire shut off from the shore the logging crew working in the bush. The engines were got on board the train, and a run made through the fire, which resulted in all the men losing hair, whiskers, and clothes. Bull's camp at Serge Narrows was burned out, with a loss of $6,000, and

SCENE ON THE DUMP—PIGEON RIVER LUMBER COMPANY.

Mose Ireland's at Bull Point, with a loss of $4,000. The log flume of the camp at Frederick Arm of Robertson & Hackett was destroyed, with a loss of $5,000.

WHY B.C. SHINGLES ARE SUPERIOR.

VANCOUVER, B. C., September 13th, 1904.

Editor CANADA LUMBERMAN:

DEAR SIR,—We find in the September number of THE LUMBERMAN an article copied from the Pacific Coast Lumber Trade Journal which conveys the idea to the readers of THE LUMBERMAN that British Columbia shingles are strictly a Japanese product, for it says: "Without going into the merits of the controversy that has been raging at Olympia and other places in this state relative to the employment of Japanese shingle weavers, it can be truthfully stated that the Japanese crews employed in the British Columbia mills turn out a better grade of shingles than the white labor employed on this side of the line," etc. This writer still further goes on to say that the trouble with white labor is that they labor too much with their jaw, and not enough with their brow.

While we must admit that things do not run just as smoothly on the other side of the line as they do in British Columbia mills, yet we do not feel inclined to attribute this to the inequality of white labor on that side of the line, as compared with Japs. And certainly not to the merits of the alleged "Japanese shingle weavers" on this side, for a Japanese shingle weaver (sawyer) is a prodigy as yet undeveloped in the British Columbia mills. At any rate I have not yet seen one.

I think that a great deal of the trouble with those little fellows on the other side of the line is that they go into the shingle business, many of them, with little other asset than a superabundance of egotism, and then when things do not "pan out" as well as they had expected, they have got to find some cause; and did you ever know of a case where one of these fellows ever traced the cause back to himself? I knew you didn't! If you could cite such a case that man would not be in the same catagory as our egotistic brother, who is invariable at variance with his men.

When I came to British Columbia, a little less than three years ago, I was told by several of those colicy fellows that it was an altogether different proposition to handle a crew of men here to what it was in the east, and that I was accepting a very unenviable position—the supervision of the largest shingle mill on the coast; that I would find gray hair coming in my head faster than it ever did before; men were a different class from the eastern men, and would not listen to any reason, but would do this and that, and I don't know what they wouldn't do—anything but what was right. These little fellows with the inward pain would not accept my position under any consideration—money wouldn't hire them. Why, it would drive a man crazy! It was really more than they could stand in their own little capacity. I, nevertheless, had the temerity to undertake the position, and have been able to hold it to the present time, and see no reason why I should not hold it for some time to come. The capacity of this mill is about a million shingles a day. I have all white sawyers and never had anything else, and must say that I have never had better satisfaction with men anywhere than I have had in British Columbia. I think we can, therefore, adduce from this that there is some other cause for the continuous ructions in the shingle business on the other side of the line than the alleged incompetence of white labor.

The trouble with our friends across the line is, when they build a little mill they want to crowd it up to about double its capacity. It is quantity, not quality, with them. With us here in British Columbia it is just the reverse; it is quality, quality, quality. These are our three essentials. Our Washington brethren have awakened to the realization of the fact that they are up against a hard proposition when they have to compete with the British Columbia shingle, and right here is where the shoe pinches them. It is not that the Washington mills, generally speaking, are animated with a desire to put a better shingle on the market—a shingle that will be a just equivalent for an honest dollar; this is not what is giving them pain, it is the fact that such a shingle is being put on the market by the British Columbia mills, or at least, some of them, and they (our Washington brethren) have got to compete or go out of business. It is rather amusing, too, to see them come over here and go through our mills, and look over our shingles. They are trying hard to catch on. I have known some of them to take home a half dozen shingles from this mill for samples. These are the fellows who blame white labor for their poor shingles, when the fact is they have to come over here themselves to find out what a good shingle is.

E. H. NEWTON,
1179 Keefer Street,
Vancouver.

Trade Opportunities

DOORS AND MOULDINGS.

Mr. J. B. Jackson, Commercial Agent for Leeds and Hull, England, in a report to the Department of Trade and Commerce, Ottawa, gives the following particulars of the demand for doors, mouldings, and inside finish:

Building operations are very active here at present, and a very large number of new houses are being built in all the large centres in this district, and there is a brisk demand for ready-made doors, mouldings and lumber for inside finishing. The price for doors and mouldings (wholesale) is as follows :—

DOORS.

1¼" x 6' 0" x 2' 0"	$0 89	$0 97	$1 11

INTERIORS.

The interior woodwork in even the better class of houses here is of very poor material, and unless it is in oak in the expensive houses is always painted and never left in the natural colour. There is an exceedingly good outlook for inside wood-work in such woods as Canadian black ash, rubbed smooth, filled and polished and left in the natural colour. There is an exceedingly good outlook for cherry or some wood of that colour.

BOX SHOOKS AND WOOD FIBRE.

The Canadian High Commissioner, London, England, reports as follows :

BOX SHOOKS.—A very considerable business is to be done in box-shooks in a knock down condition when supplies are available for export. An important enquiry has also been received from South Wales for elm boxes suitable for packing tin plates and block plates What are required are elm boxes in the standard sizes, ready cut to be nailed together here. The total output of the Welsh tin-plate works is very considerable, and a fair proportion of the wood needed would be of the standard sizes. Advertising for these boards has only elicited one reply from Canada, and this was unacceptable, as a different wood was offered, whereas elm is the only variety suitable for the purpose.

WOOD FIBRE.—There has been some difficulty in procuring for correspondents on this side the names of Canadian houses actually in a position to export wood fibre, an article for which there is a good demand if prices are favorable.

Mr. J. B. McNamara, Commercial Agent at Manchester, England, writes :

BOX BOARDS.—An ever-increasing demand exists in the Manchester district for box-boards, and preference in all cases for a Canadian supply is shown. Orders have been entrusted to Canadian mills and in some cases dissatisfaction has resulted, and I think I am justified in quoting from a letter of recent date received from large soap and chemical manufacturers who say :

"We have had several consignments from different Canadian mills ; the results as far as we personally are concerned have not been satisfactory, owing (1) to the want of uniformity in the cutting and the variation in the thicknesses. (2) The fact that deliveries have been most irregular, and consequently even if the quality was satisfactory, it would be impossible for us to depend on such sources of supply for any considerable proportion of our total consumption. We shall be glad to go into this matter with you at any time, if there is reasonable probability of these difficulties being overcome. It is hardly necessary for us to add that the consumption by the soap trade alone is sufficiently large in this country to make it worth while going into the matter, and that on level terms we should undoubtedly give the preference to a British source of supply."

INQUIRIES RECEIVED.

By the High Commissioner of Canada, London England : Inquiry has been made for supplies of red cedar from Canada.

By the Curator Canadian Section, Imperial Institute, London, England : (1) A Liverpool timber company is prepared to receive quotations from Canadian manufacturers of barrel staves, hoops and headings, f.o.b., Montreal.

(2) A firm in Amsterdam, Holland, asks to be placed in touch with Canadian manufacturers of office desks.

(3) A firm of furniture manufacturers asks to be placed in correspondence with Canadian shippers who can supply birch ½-inch to ¾-inch by 10-inch to 20-inch wide.

By J. B. McNamara, Commercial Agent, Manchester, England : A Manchester firm desires to correspond with Canadian makers of wood bungs and faucets and wooden tops for soda water bottles.

SEMI-READY HOUSES.

An exhibit which could not fail to attract the notice of all visitors to the Winnipeg Dominion Exhibition was that of the British Columbia Mills, Timber and Trading Company, Limited. Standing boldly out in line with the colonade facade of the Exhibition buildings, could be seen a fine row of cottages looking, with their perfectly finished exteriors, as though a village scene had been planted in the very midst of the Exhibition. This exhibit consisted of five houses erected on a long raised platform, so as to bring them into better prominence. They were brought from British Columbia by this company in sections ready for erection, and served as a very forcible demonstration of the great utility of their "patented" method of sections. The idea is not that of merely a portable structure, but of a method of constructing a building in detail at the factory and transporting it in sections ready for building as a permanent erection. The object of the company is to meet the increasing difficulties which arise consequent upon the rapid setlement of the Dominion, and by this means to provide, permanently and quickly, a warm substantial dwelling for the family of average means.

These houses have been specially constructed to resist the severity of the Northwest climate ; a double air space has been arranged to the walls, which are double boarded outside and inside, with an ample supply of weather paper. The joints are of a "patented" lock joint principle secured by bolts, which gives perfect rigidity to the building.

One of the houses shown was a very pretty one-story dwelling 24x28 feet having the wide projecting eaves and bell shaped roof. It is of ¾ boarding inside and outside, finished with shingles throughout, and presents an attractive and comfortable appearance. It is most substantially built, and calculated to withstand all the rigor of the cold climate. There were a series of cottages designed to meet the needs of the home-steader, miner, or rancher, and whilst being particularly easy of erection, they are at the same time warm in winter and cool in summer, the same details for protection being carried out as were explained for the more imposing buildings. Another was a very handsome house suitable for town use ; it has a bay window front with porch and balcony, and a concave roof, with wide eaves, giving it a particularly pleasing appearance, and was greatly admired by those interested in building.

ONE OF THE B. C. MILLS, TIMBER AND TRADING COMPANY'S SEMI-READY HOUSES.

These houses are made in British Coumbia, all the many parts being carefully numbered so that the veriest novice should make no mistake in their erection. The inside finish was carried out in various styles, one was plastered and then decorated, another was lined with ¾ tongued and groved boards, canvased and papered, to show the result when plaster was not available. The enquires for these houses were very numerous and the company are making preparations for an extensive trade. The range of houses as they stood was sold several times over. The head office of the British Columbia Mills, Timber & Trading Company is at Vancouver, B. C., their Winnipeg branch being located at 64 Merchants Bank Building.

The C. H. Mortimer Publishing Company of Toronto, Limited,

CONFEDERATION LIFE BUILDING, TORONTO.

BRANCH OFFICES:

38 ALLIANCE BUILDING, MONTREAL.
310 McINTYRE BLOCK, WINNIPEG.
21 GREAT ST. HELENS, LONDON, E. C.

The LUMBERMAN Weekly Edition is published every Wednesday, and the Monthly Edition on the 1st day of every month.

TERMS OF SUBSCRIPTION:

One Copy, Weekly and Monthly, One Year, in advance, $1.00
One Copy, Weekly and Monthly, Six Months, in advance, 50
Foreign Subscription, $2.00 a Year.

ADVERTISING RATES ON APPLICATION.

THE CANADA LUMBERMAN is published in the interests of the lumber, wood-working and allied industries, being the only representative in Canada of these important interests. It aims at giving full and timely information on all subjects touching these interests, and invites free discussion by its readers.

Especial pains are taken to secure for publication in the WEEKLY LUMBERMAN the latest and most trustworthy market quotations throughout the world, so as to afford to the trade at home and abroad information on which it can rely in its operations. Subscribers will find the small amount they pay for the CANADA LUMBERMAN quite insignificant as compared with its value to them. There is not an individual in the trade, or specially interested in it, who should not be on our list, thus obtaining the present benefit and aiding and encouraging us to render it even more complete.

Advertisers will receive careful attention and liberal treatment. For manufacturing and supply firms wishing to bring their goods to the attention of owners and operators of saw and planing mills, wood-working factories, pulp mills, etc., the CANADA LUMBERMAN is undoubtedly the cheapest and most profitable advertising medium. Special attention is directed to "WANTED" and "FOR SALE" advertisements, which are inserted in a conspicuous position on front page of the Weekly Edition.

JUSTICE TO HOME INDUSTRIES.

The buyer and consumer of lumber should be sufficiently loyal to his country to purchase his requirements from the home manufacturer whenever he can do so with no disadvantage to himself. In these days of keen competition it is a rare exception to find a person who is loyal at the expense of his pocket, and who is willing to pay a higher price for a home manufactured article than for an imported article of equal quality. If, however, the home product can be obtained upon as favorable terms, there is absolutely no excuse for a merchant or consumer contributing to the prosperity of manufacturers in foreign countries.

It will be noticed that the lumber imports from the United States are steadily increasing. Why this should be the case is not clear. Is it not reasonable to expect that manufacturers who have invested large sums of money in logging equipment and saw mill plant, and are giving employment to Canadian workmen, should receive the patronage of Canadians? We do not think that this fact can be too strongly emphasized. The saw mill capacity of Western Canada is now sufficient to more than supply the lumber demand of that district, and there is absolutely no reason for the importation of American lumber. The British Columbia lumber and shingle manufacturers having acquired a reputation for the excellence of their product, there need be no fear on that ground. In the advertisement pages of this journal there are to be found the announcements of many of the largest and most progressive manufacturers of British Columbia and the Lake-of-the-Woods district, and we strongly advise all prospective buyers of lumber, shingles and other mill products, to give them the opportunity of figuring on their specifications before placing their orders for American lumber. It should not be forgotten that United States lumber is shipped into Canada free of duty, whereas Canadian lumber exported to our southern neighbors is taxed to the extent of $2 per thousand feet. Is the Canadian manufacturer, therefore, not entitled to consideration at the hands of the Canadian dealer or consumer?

BOX SHOOKS IN DEMAND.

Does not the manufacture of box shooks offer a promising field for expansion? Considering the large number of white pine and spruce mills, there are very few shook plants. In addition to supplying the home demand, as is now done, we should do a large export trade, for there is a wide market for such goods, particularly in Great Britain. A communication which we recently received from a London importing firm shows, first, that there is a large demand for box shooks, and, secondly, that under equal conditions Canadian manufacturers will in some cases at least be given the preference. We quote from their letter: "We have been engaged in the box shook business for some time and have a very extensive connection with the large manufacturers of soap, candles, sugar, canned milk, biscuits, etc., using imported shooks in spruce and pine for packing purposes. Our great difficulty has been to find manufacturers on your side capable of supplying the wood, which has to be cut to specification and bundled in the usual way and then shipped to our large importing centres by regular liners. There is an enormous business to be done and we ourselves could place orders at current prices for many millions of feet. Our manufacturers generally are in favor of giving preference to colonial sources of supply, but owing to the difficulty in getting the business properly taken up in Canada by able and responsible parties, a large proportion of the orders are placed in Norway and Sweden." Any of our readers who may be interested will be given the name and address of the firm upon request.

WHITE PINE AS A MARKET FACTOR.

It must be evident to all who have kept in touch with the lumber production that white pine is no longer the important factor it once was in the North American lumber market. The maximum of production was reached some years ago, and it would appear that the period of decline which then commenced is likely to continue for some time yet. The States of Michigan, Wisconsin and Minnesota comprise the leading centre of the white pine industry, and it is in these States that the declining tendency has been most noticeable. Since 1872 there has been cut in these three States 90,000,000,000 feet of white and Norway pine, the summit of production for one year being reached in 1890. Since the same year the entire Northern pine production has been upwards of 190,000,000,000 feet. Even during the hard times from 1893 to 1897, the yearly output averaged nearly 7,000,000,000 feet, whereas last year with the added stimulus of prosperous times and an active demand for lumber, the production fell to below 5,000,000,000 feet.

Mr. Rhodes, secretary of the Mississippi Valley Lumbermen's Association, in a recent report, draws attention to the heavy production of other woods last year in contrast to that of pine. The increase in the production of southern pine over the year before was more than 500,000,000 feet, and the increase in the hemlock output has been even more rapid. In 1897 there was produced in Wisconsin and Michigan 462,000,000 feet of hemlock; in 1903 it was 1,500,000,000 feet. There is believed to have been produced in the Pacific Coast States last year 4,500,000,000 feet of lumber. Thus, while the production of white pine has declined as the result of the exhaustion of the forests, other kinds of lumber have been produced in larger quantities, and have been sold in channels and for purposes where a few years ago white pine alone was known.

While white pine has lost ground so far as the volume of output is concerned, it must be admitted that it still holds its advantage from the standpoint of popular favor. Perhaps never in the history of the white pine trade has competition from other lumber been so severe as during the past summer, yet prices declined very little. While yellow pine and Pacific Coast lumber were sold at a reduction of from $4 to $8 per thousand under their average, the decline in white pine did not average more than $2. This circumstance demonstrates clearly that white pine still occupies an invulnerable position and that it can maintain its supremacy even under conditions of severe competition from the cheaper woods.

The decreased production of the past few years emphasizes the intrinsic value of standing white pine, and a conservative policy of operations should be followed by all owners of pine limits. Whether or not there exists necessity for curtailment, such a course is advisable, for the timber is certain to greatly appreciate in value if left in the tree, while if cut it may have to be sold in a sluggish market.

ADJUSTMENT OF FREIGHT RATES.

When the Dominion Transportation Commission was created it was generally known that there was a large field for its labors, for the transportatian problem had become one of great perplexity in Canada. The need of such a Commission has been demonstrated by the results which have already been accomplished. The lumber trade, in its broadest sense, is as much indebted to the Commission as perhaps any other branch of industry, and before the final summing up there promises to be still more reason for gratification. It has long been the claim of lumbermen that unfair freight discrimination existed, and the investigations of the Commission prove such to have been the case. Reference may be made to one or two of the most important matters which have been adjusted.

The custom of the railway companies has been to charge a higher freight rate on the transportation of cedar timber products, such as lumber, railway ties, poles, and fence posts, as compared with the rates on common lum-

ber. After taking evidence, the Railway Commission issued an order that the railway companies cease from levying tolls on cedar products, and that such products shall be added to the list of commodities which are included in the term "common lumber" and are classified tenth class in carloads. It is the general opinion of the lumber trade that the object of such discrimination against cedar products was to enable the railway companies to purchase cedar ties, posts, etc., for their own use upon more favorable terms than if they could be exported at a low rate of freight.

The rates charged for the transportation of cooperage stock formed another subject for investigation. Until recently the rate on cooperage stock from the Western Ontario mills to Montreal was 16½ cents per one hundred pounds to Montreal, both for local and export, including terminals and cartage. This rate, which was in effect for several years, was increased by the railroad companies to 18 cents for local consumption, not including cartage, and 19½ cents for export, including terminals. The evidence submitted showed that the export business was falling off owing to the increase in rates, and that cooperage stock which was formerly shipped to England from points in Western Ontario is now being shipped from mills in Indiana and Louisiana through Baltimore, New York and New Orleans, owing to the more favorable freight rates given by the American roads; also that the result of the increase had been to displace cooperage stock in favor of cotton bags at the Montreal flour mills and refineries. The Commissioners decided against the railroads by reducing the rates to 16½ cents for local consumption and 18 cents for export, including terminals. While the rates were not restored to the former basis, the cooperage stock manufacturers are satisfied with the decision reached by the Commission.

The case submitted to the Commission by the British Columbia Lumber & Shingle Manufacturers' Association was one affecting diversified interests. The manufacturers of the Coast requested that the freight rate from coast points on clear cedar and fir be made identical and that the same rate be given on these commodities from coast points to Manitoba and the Territories as is given from the mountain mills of British Columbia. The mountain, or interior, mills are given a straight rate of 33 cents on all classes of lumber to Winnipeg, whereas the coast mills must pay 40 cents on fir and 50 cents on cedar. Arguments in favor of a readjustment of the rate were presented by the coast manufacturers, while the mountain manufacturers appeared before the Commission with evidence in justification of the discrimination. The mountain manufacturers claimed that they were entitled to a lower freight rate on account of the shorter haul, the inferior class of timber and the consequent lower prices to be obtained for their product. The decision of the Commissioners is anxiously awaited.

Mr. Cuddy, of the Harrison River Mills Company, is now on the road for the Arrowhead Lumber Company, of Arrowhead, B. C.

THE HOO-HOO ANNUAL.

The thirteenth annual meeting of the Hoo-Hoo Order, which was held at St. Louis, Mo., on Thursday and Friday, September 8 and 9, was one of the most important in the history of the organization. There were upwards of 500 Hoo-Hoo present. The limit of membership, 9,999, having about been reached, the important question of raising the limit was considered, with the result that a resolution was adopted extending the number to 99,999. Sentiment was overwhelming by in favor of this change. Another important conclusion reached was to introduce a system of insurance into the Order. It was resolved to adopt a proposition submitted by W. E. Nichols, of the New York Life Insurance Company. The proposition in brief is to insure the members of Hoo-Hoo for any amount not less than $999.99 without the requirement of a physical examination, provided 70 per cent. of the membership is secured. In addition, the company agrees to give the Order 40 per cent. of the first year's premiums as a joint agent's commission, the fund to go into the general treasury of the Order. It is not compulsory on any member to take insurance, and if 70 per cent. of the members do not insure, the entire scheme fails.

The report of Supreme Scrivenoter J. H. Baird showed that the receipts for the year ending September 9, 1904, had been $28,248.36, and the disbursements $22,101.48, leaving a cash balance on hand of $6,146.88. There were held during the year 117 concatenations, concerning which the Scrivenoter says: "It will be seen that the American Flag will have to make a salute to the Cross of St. George, since the largest number of initiates falls to the credit of Vicegerent W. C. Laidlaw, of the Eastern District of Canada, being six concatenations with 133 initiates.

The Scrivenoter read the following communication from Jamie "Hoot Mon" Lightbody, of Glasgow, Scotland, who was initiated in Toronto May 27th, 1904, and was the first member of the Order in Scotland.

Glasgow, August 26, 1904.

When glancing over my Hoo-Hoo book
On page 13 I chanced to look
There article 4 and section 3
Asks "On 9th September where will you be?"

I'll be in Glasgow, my native toon,
Amongst the heather I'll sit doon,
And think o' the time when once I sat
On the dry kiln to be made a great black cat.

'Twas in the merry month o' May,
I think it was the 27th day,
That thro' the bed I tried to walk
And to swallow the lather I was taught.

Walter C. Laidlaw was the Snark,
And among others who did take part
Were Clarence Ten Eyck and Jamie Cain—
Oh, Lord, they nearly turned my brain.

At "Low Bridge" and "Step High" I did my best
Not a second would they let me rest
Till I had kissed the cat on the sacred spot
And found my eyesight I had got.

Let this be known both far and near,
Hoo-Hoo has given me a prosperous year.
Luck attend the Annual on 9th September
Is the wish to all from the only Scotch Member.

I enclose a weebit sprig o' heather,
Let bonds of friendship never sever,
Join Britain and America, president and king,
"God bless them both," come let us sing.
Not Robert Burns

The reading of the poem eiicited much applause.

There was no contest for the Supreme Nine except for the office of Snark of the Universe, for which Chas. D. Rourke, of Petersburg, Ill., and Frank N. Snell, of Milwaukee, were nominated. Mr. Rourke was successful by a vote of nearly two to one. The other officers elected were:

Senior Hoo-Hoo—John S. Bonner, Texas.
Junior Hoo-Hoo—A. C. Ramsay, St. Louis, Mo.
Bojum—George V. Denny, Savannah, Ga.
Scrivenoter—J. H. Baird, Nashville, Tenn.
Jabberwock—A. H. Potter, Portland, Ore.
Custocatian—E. S. Boggess, Clarksburg, W. Va.
Arcanoper—W. C. Laidlaw, Toronto, Canada.
Gurdon—Gardiner I. Jones, Boston, Mass.

It was decided to hold the next annual in Portland, Oregon. Perhaps Toronto in 1906.

HOO-HOO FUNCTION AT SARNIA.

There was a great gathering of Hoo-Hoo in Sarnia on Friday, September 2nd, and a number of kittens were added to the black cat family. Great Snark W. C. Laidlaw, of Toronto, was present to look after the kittens. Mr. Charles Hadley, of Chatham, was also in evidence. Mr. J. M. Diver, the oldest Hoo-Hoo in Canada, was in charge of the local arrangements, which was a guarantee that everything would be carried out in proper style. Mr. Geo. Belton, his first lieutenant, lent charm to the occasion and assisted in the proceedings, while Mr. Findley McGibbon was a whole host in himself. The afternoon was spent in looking round the town and in arranging for the evening's proceedings, the cats and kittens riding to the sawmills on a tour of inspection in the Hoo-Hoo cab, which consisted of a stick of timber from the Cleveland-Sarnia Saw Mills Company measuring 20 inches square and 41 feet, six inches long, with a foot rest along each side consisting of a 3 x 9 inch joist 41 feet in length.

Two teams of draft horses from the mills, decorated with flags, hauled the big stick, which contained 1,383 feet, and was mounted on four heavy wheels.

The proceedings took place in the C.O.F. hall. About sixty pur-blind kittens were introduced into the

mysteries of Hoo-Hoo, among them being Chas. Mackenzie, S. P. W. Cooke, A. D. Morrow, P. L. Patterson, A. S. Hill, Jas. Murdoch, W. F. Cameron, C. E. Stoody, F. J. Loughead, F. F. Pardee, J. J. Shortreed and W. M. Hood, of Sarnia; and D. A. Leitch, of Ridgetown.

At the conclusion of the ceremonies the party adjourned to the Vendome Hotel, where an elaborate banquet was held.

The following poems were contributed by a local composer:

9 LISTEN 9

Sarnia the town of Saw-mills and Lumber,
Awaited with joy the Hoo-Hoos this year.
Ra! Ra! for Sir Kittens, Huzzahs without number,
Nothing must mar our good will or good cheer.
In tales of adventure may the Kittens excel,
And may fellowship reign till they bid us farewell.

9 9 9 9 9

Who can be purrlike, also bold,
Who can a funny tail unfold,
To make your blood run hot or cold,
THE KITTENS.

Who when he lies, lies very fair
Of Rats and Mice and midnight scare
Of hunting birds of species rare,
THE KITTENS.

The Black Cat blandly watches all,
Sir Kittens big and Kittens small,
And winks an eye at stories tall,
OF KITTENS.

The black cat supplied by Mr. Diver was, as may be inferred from the illustration, a creditable production of the Hoo-Hoo deity.

Our congratulations are extended to Mr. W. C. Laidlaw, of Toronto, who, at the recent annual meeting of the Cancatenated Order of Hoo-Hoo at St. Louis, Mo., was unanimously elected to the position of Arcanoper. Mr. Laidlaw is the first Canadian to be honored by election as one of the Supreme Nine.

BRITISH COLUMBIA SAW MILLS

Photographed and Described by Our Travelling Representative.

THE NORTH STAR LUMBER COMPANY.

Among the larger mills of the west the business carried on by the Hanbury Manufacturing Company, of Brandon, Manitoba, takes a very prominent position. During the past few years the increased immigration to Manitoba and the Territories created an increasing demand for their manufactured lumber, necessitating the purchase of further limits and an increase in the mill capacity. With a view to enable them to be prepared for further demands upon their stocks, the company purchased in September, 1903, the new mill of the North Star Lumber Company situated four miles east of Cranbrook, B. C., on the North Star branch of the Crows Nest Pass Railroad.

SAW MILL OF THE YALE COLUMBIA LUMBER COMPANY, NAKUSP, B. C.

The property was generally overhauled, new machinery, including a new carriage, steam nigger, boiler and conveyors, being added, the capacity also being increased from 28,000 feet to 50,000 per day of ten hours.

The plant stands on a site of twenty-five acres away from any body of water, the company's limits of 7,000 acres of pine, fir and tamarac surrounding it on all sides. At the time of writing a planing mill is being built to take care of the output and prepare it for the market. It is to be thirty-two feet long by forty feet broad and will be equipped with three Goldie & McCulloch planers.

The principal timber cut by this firm is fir and pine, with a small proportion of tamarac. Most of the output is marketed in the Territories and Manitoba.

Mr. John Hanbury, the proprietor and general manager of the entire properties, is widely and favorably known to be a man possessed of great ability, his enterprise and shrewdness of management having proven great factors in the growth of the business during the past six years.

Mr. J.M. Agnew, the manager of the North Star mill just described, has had a remarkable career of success, and although as yet under thirty-two years of age, gives promise of developing into one of the brightest and ablest mill managers in British Columbia. Mr. Agnew, taking the advice of Horace Greely, the great American citizen, set out from his home in Brantford, Ontario, for the land of promise, Manitoba, just nine years ago. With exceptional pluck and desire for employment irrespective of the class of work offered, he immediately went to work as yardman with his present employers. Step by step he gained recognition and promotion for the faithfulness and ability displayed in his work, the culminating step arriving on March 7th, 1904, when Mr. Hanbury offered him the position of manager of the newly purchased property in British Columbia. Previous to his departure for that province a banquet was given in his honor at Brandon, the company presenting him with a handsome gold watch and a check for $500.

THE YALE COLUMBIA LUMBER COMPANY.

The Yale Columbia Lumber Company, Limited, are among the largest operators in lumber in the interior of British Columbia, owning mills at Nakusp, Robson and Cascade. Apart from the above three mills, Mr. Jos. Genelle, the manager, and Mr. Billings, the secretary, have just lately purchased the Kootenay River Lumber Company's mill at Nelson, running it in partnership as a separate concern.

The company own their own limits, possessing 65 square miles of fir, cedar, spruce,

TWO OF THE YALE COLUMBIA LUMBER CO.'S TUGS.

white pine and tamarac along the banks of the Columbia River and the upper and lower Arrow Lakes. The logs are towed to the mills by the company's tugs, these being three in number.

THE NAKUSP MILL.

At Nakusp the company established their headquarters as far back as 1897. The plant, consisting of a saw and planing mill, occupies a site of 10 acres along the shores of the Upper Arrow Lake. It is splendidly situated and possesses connection with the main line of the C. P. R. by boat to Arrowhead, and the Crow's Nest Pass Railroad by a line from Nakusp to Roseberry, boat from Roseberry to Slocan City and thence by railroad to Nelson.

The mill is 30x130 feet in dimensions and is equipped with circular saw, edger, trimmer and the various other requisites of a first-class plant. The planing mill attached is equipped with four planers, surfacer, matchers, sticker, band resaw and rip saw. The log deck is equipped with steam kickers, loaders and niggers, the carriages being worked by a steam feed.

Power for driving the machinery is obtain-

SAW MILL OF THE NORTH STAR LUMBER COMPANY, CRANBROOK, B. C.

ed from two 90 h. p. boilers and two 90 h. p. engines. Electric light is supplied by an engine and dynamo. Nearly all the machinery was supplied by the Wm. Hamilton Company, of Peterborough, Ont.

Situated twenty yards from the mill is a dry kiln 75x30 feet for drying the finer grades of lumber, all the rest of the output, which averages 50,000 feet per day, being piled in the yard and sheds.

Most of the output is marketed in the Slocan district, Northwest Territories, Manitoba and Ontario, the company's mouldings and rough and dressed lumber being in high favor in the districts enumerated. A very large trade is carried on with the C. P. R. and other companies in cedar and fir piles, telephone and telegraph poles, fence posts and ties for the railroad.

THE ROBSON MILL

Situated three miles above West Robson, on the Columbia, is almost an exact reproduction of the one already described, the capacity being 40,000 ft. per day.

THE CASCADE MILL

is situated one mile west of Cascade on the Kettle River. It possesses a capacity of 25,000 feet per day and does a large trade among the mines of the Boundary, besides shipping considerable stock to the Northwest.

THE NELSON MILL

was built last year, at a cost of $30,000, right on the wharf where direct communication is obtained with the Crow's Nest Road. It is fitted up with all the requisites of a modern plant, the machinery being supplied by the Wm. Hamilton Company, Peterboro, and the Waterous Engine Works Company, Brantford.

Mr. Jos. Genelle was raised in Ontario and has for 30 years been engaged in the trade. He came to British Columbia in 1886 shortly after the completion of the C. P. R., and built mills at Shuswap Lake and Sprout's Landing on Columbia River, just lately disposing of these properties to the Columbia River Lumber Company. Mr. Genelle is widely known in the Kootenays as a man of sterling qualities both in business and socially, and it is through his enterprise that the business has grown to its present enormous dimensions. He is ably assisted by Mr. Billings, a young Ontario gentleman possessed of all the snap and energy usually associated with the Ontario people. Coming to British Columbia a few years back he at once entered the employ of Mr. Genelle as secretary, displaying such ability as to be soon sought by the various lumber companies around, finally being persuaded to join hands with the Columbia River Lumber Company. He stayed with them for a year or more, leaving them in 1901 to enter into partnership with the present company.

Any person who is interested in the lumber business or in western Canada's thriving industries will be amply repaid by a visit to any of the company's up-to-date establishments.

Mr. John Birdsall, of Niagara Falls, traveller for the Bradley Lumber Company, of Hamilton, died in the city hospital, Hamilton, a fortnight ago from typhoid fever, after two weeks' illness. He was 30 years of age.

THE SEASONING OF TIMBER.

The object of seasoning timber is either to expel or evaporate the sap remaining in it, which otherwise putrifies and induces decay.

One of the effects of seasoning is to materially reduce the weight at the time, and this reduction of weight is, to some extent, an indication of the success of the process. Tredgold calls timber seasoned when it has lost one-fifth of its weight, and says it is then fit for carpenters' work and general purposes. The same authority gives it as dry when it has lost one-third of its weight, when it is fit for joiners' work and framing. The exact loss of weight is dependent of course upon the nature of the timber and its state before seasoning. One method of facilitating seasoning and preventing checking of valuable timber in the log, is to have an auger hole through the centre of the log from end to end. Natural seasoning of the ordinary kinds of lumber is carried out by a system of stacking in such a way that the air can circulate freely around each piece, but it must be protected by some kind of roof from rain and sun. When logs are stacked for seasoning it is usual to keep the top ends slightly raised; this in reality is for convenience in taking out any particular piece required. Some authorities claim that timber will season much better and quicker by being stood up on end, but this is hardly practicable on account of the difficulty in raising and retaining such heavy masses of timber. According to some good authorities the time for seasoning thoroughly is about as follows, the material being protected from the weather by sheds:

		Months. Oak.	Fir.
Square timber,	24 inch and up	26	13
"	24 inch to 20	22	11
"	20 inch to 16	18	9
"	16 inch to 12	14	7
"	12 inch to 8	10	5
"	8 inch to 4	6	3

It is found that if the material is kept longer than the periods named the fine shakes which show upon the surface in seasoning will open deeper and wider, until they render the stick unfit for any fine class of work.

Experience shows that when the seasoning process is carried on under suitable cover the time required is about five-sevenths that of seasoning in the open.

Water seasoning consists in totally submerging the timber as soon as cut, it being chained down for some two weeks, during which time the greater part of the sap is driven out by the action of the water. It is then removed and exposed to the air, being carefully turned each day, till thoroughly dry; when seasoned in this way the timber is not so liable to warp and check, but as the presence of the sap in the stick increases its strength and elasticity, this process must necessarily weaken it for some purposes. Care has to be taken to see that the log is kept fully submerged, as in the event of a portion being exposed to the air the timber suffers along the water line. Another precaution is necessary where water seasoning is employed—the saturated timber must be allowed ample time in which to dry before being put to use, because if taken from the water straight to the saw and used wet dry rot will quickly appear in it.

Saturation in salt water has the effect of hardening the timber, also making it heavier and more durable, but is undesirable for ordinary building purposes, as it causes a tendency to attract moisture.

Boiling water, according to Tredgold, quickens the operation of seasoning and causes the timber to shrink less, but is expensive to use and reduces its strength and elasticity. The time required varies with the size and density of the material, and according to circumstances, one rule being to allow one hour for every inch in thickness.

Steaming has much the same effect upon timber as boiling, but is said to accelerate the drying process, and by some authorities is considered as a preventative to dry rot.

Hot air seasoning or dessication is effected by exposing the timber to a current of hot air in a kiln, by which means the sap is entirely dried up, this process taking only a comparatively short time, according to the sizes of the pieces; when the wood is very green the heat in the kiln must be turned in gradually, or the timber will be checked and injured. Britton gives the opinion that this form of seasoning is only useful for comparatively small sizes, as the expense of applying it to large timber is very great; moreover, as wood is one of the worst conductors of caloric, if this plan be applied to large logs the interior fibres still retain their original bulk, while those near the surface have a tendency to shrink, the consequence of which is to cause cracks and shakes to appear of more or less depth. Dessicated wood must not be exposed to any moisture before use. Laslett claims that during this process ordinary varieties of wood lose their strength and colored woods become pale and wanting in lustre.

McNeile's process, which consists of exposure to a moderate heat in a moist atmosphere charged with various gases, produced by the combustion of the fuel, has been in operation for some years; the material is placed in a brick chamber containing a large surface of water to produce evaporation, the timber is stacked in the usual way with free air space round each piece, calculating about one-third of the chamber space for air; under the chamber is the furnace, which circulates the products of the combustion (among which is carbonic acid gas) freely in a moist state around the contents. The time required varies with the nature of the wood. Oak, ash, mahogany and other hard wood planks, three inches thick, take about eight weeks; flooring boards and panelling about ten days or two weeks.

The greener the timber when first put into the kiln the better, and as a rule, if too great heat be not applied, not a single piece of sound timber is even split or warped or checked in any way. The wood is rendered harder, denser and tougher, and dry rot is entirely prevented. The wood will not absorb by subsequent exposure to the atmosphere nearly so much moisture as if dried by exposure in the ordinary way. Hence it is better than air dried wood for all purposes, and the process seems to have no injurious effects upon the appearance or strength of the timber.—Northwest Contractor.

WOOD PULP DEPARTMENT

FRANCE WANTS WET PULP IN ROLLS.

Mr. A. Poindron, Canadian Commercial Agent at Paris, France, writes to the Department of Trade and Commerce as follows :

"What the French paper manufacturer requires is a good fibrous pulp which will give him the least possible trouble to manufacture into paper and the least possible loss through breaches of the fibre, and in both senses they are inclined to give the preference to the wet pulp sheets over the dry sheets, and to the wet pulp sheets in rolls over the wet pulp in boards.

"The Canadian wet pulp manufacturers ship yearly largy quantities of their products to Great Britain, and the Canadian statistics show that during the fiscal year 1903 they have exported pulp to England to the value of $1,129,173. In fact, the rates of freight from Canada to British ports are altogether higher than the rates from Sweden and Norway to the same ports, and if Canadian pulp manufacturers can afford to export to Great Britain in competition with Sweden and Norway, it is likely that, through cheaper cost of manufacturing the chemical pulp in Canada, they can counterbalance the extra cost of ocean transportation to Great Britain. This would also be possible so far as French ports are concerned.

"The Canadian pulp manufacturers, when asked from France for quotations c. i. f. a French port not in direct communication with Canda by a regular line of steamers, should always figure on large quantities and specify the same in quoting, as the cheap transportation required by wood pulp exports does not allow for transhipment. Quotations applying to deliveries in the ports of Dunkirk, Rouen, Nantes, Marseilles, which are not yet regularly connected direct with Canada, but which are the nearest ports for a number of the large importing manufacturers, are frequently wanted. For full cargo quantities, satisfactory quotations to the above ports, either by tramp or by sailors, would likely be obtainable from any of the Canadian ship-brokers. I beg to add that contracts for full cargo deliveries are currently obtainable in France. As concerns Le Havre and La Pallice deliveries, Canadian manufacturers, through the existing direct steamship connections, are now in a suitable situation to book smaller orders or periodical delivery contracts.

"In brief, if the export of wood pulp does not develop, it is not owing to want of attention on behalf of French importers, but owing only to want of offerings on behalf of Canadian exporters. When the prices offered in Great Britain are low, they undertake to give a little more attention to the French outlet, but, unfortunately, when such is the case, as Canadian exporters have no steady agents appointed in France nor connections previously worked, they try to rush by correspondence, dealing with people who don't know them, don't know their goods or what they are able to manufacture."

INCREASED COST OF PULP WOOD.

Paper manufacturers are pointing to the gradual increase in the cost of pulp wood since 1898 as a justification of the higher prices for paper. By way of comparison it is cited by United States paper manufacturers that, while previous to 1898 their supply of domestic pulp wood cost them, delivered at the mills, between $5 and $6 per cord, the present cost of wood is between $7 and $8 delivered. A corresponding advance has also taken place in the cost of Canadian pulp wood. Rough spruce logs that used to cost from $3 to $4 per cord f. o. b. cars, are now quoted at from $4.50 to $5. Peeled spruce wood, that sold for $3.50 to $4.50 per cord five years ago, is now selling at from $5.50 to $6 per cord f.o.b. cars. Poplar logs in the United States, that used to cost $6 per cord and less delivered, now cost the paper manufacturers nearer $9 per cord. Canadian poplar has advanced from $3 to $3.50 to $5.50 and $6 f.o.b. cars. Besides the increased cost of the wood freight rates have also advanced within the same time. But, notwithstanding the increased cost of their raw material, it is claimed that the selling price of paper has not advanced proportionately.

Speaking in regard to pulp wood and its increased cost, an authority on the subject explains the advance as follows :—"Previous to 1898 the situation in the various lines of trade for a number of years had been unsatisfactory. As a result of the depression the lumber business was in a bad way. Because of the low prices many sellers of lumber had to discontinue business. Pulp wood was, therefore, cheap, as every timber land owner who happened to need some cash sold his wood. It was his best asset upon which to get a ready return in cash. Times were so hard that there was an over supply of wood for sale. Naturally the price of lumber and pulp wood declined. Beginning in 1898, however, the Spanish war gave an impetus to general business, and the price of lumber, in common with every other commodity, began to advance. Timber that had been costing $12 to $13 per thousand feet advanced to $18 to $20 per thousand feet. In this connection I want to state that the idea that pulp wood is not suitable for any other purpose than to be ground into pulp is erroneous. In the absence therefore of a splendid supply of cheap pulp wood the buyers had to bid on the better material, and of course had to pay correspondingly for it."

THE PULP INDUSTRY IN BRITISH COLUMBIA.

The pulp industry will soon be an important one in British Columbia. The Quatsino Power and Pulp Company, which has 125 square miles of the finest timber on the west shore of Vancouver island, will commence the construction of a mill before January next, the papers, it is stated, being signed. Mr. J. A. Moore, of the Moore Investment Company, of Seattle, is largely interested in this company.

Other Seattle people compose the Bella Coola Power and Pulp Company, and Mr. A. E. Williams, manager, and Mr. R. M. Thompson, secretary, have just returned to Vancouver from a season's survey and cruising of the limits. Work will be resumed in the early spring, when a saw mill will be erected first.

The Pacific Coast Wood Pulp & Paper Company has large limits near Powell river, about 80 miles north of Vancouver on the mainland coast, and the company is now being floated in London.

The Oriental Power and Pulp Comany has already its buildings at Swanson Bay under way, and will be manufacturing inside of a year and a half. Its concession contains 83,000 acres. This is a subsidiary company of the Canadian Financial Syndicate.

SISSIBOO PULP PROPERTY SOLD.

The Sissiboo Pulp and Paper Company's properties, situated at Weymouth, Nova Scotia, were sold at foreclosure sale in Digby by Deputy Sheriff Burnham on September 13th, and were bought by Mr. A. G. Ross, of Montreal, manager of the National Trust Company, the plaintiffs in the suit ,on behalf of the bond-holders. Among those present and bidding were Messrs. W. G. Clarke, of Clarke Bros., Bear River, and G. D. Campbell, of G. D. Campbell & Co., Weymouth. The properties comprise about 25,000 acres of good timber land covered with spruce, pine, hemlock and hardwood, two pulp mills equipped with eleven grinders, compressors, wet machines, and all the necessary appliances, a large dam constructed of solid masonry, one of the best in the province, a long wharf at Weymouth Bridge with a large warehouse shed 50 by 200 feet, offices, stores, smithy, dwelling house, village lots, etc. The Sissiboo Pulp and Paper Company was incorporated in 1899 with $250,000 bond issues. Upwards of $300,000 was expended in acquiring the limits, the mill sites, the construction of dams and plant, and machinery equipment. Owing to the unfortunate flood of 1901 and the general depression in the pulp trade the concern was forced to suspend operations.

PULP NOTES.

Great Britain's imports of wood pulp are steadily increasing, as the following figures show : 1901, 448,455 tons; 1902, 525,799 tons; 1903, 576,003 tons.

The Laurentide Pulp Company, of Grand Mere, Que., recently reduced their dividend from 8 to 6 per cent. annually. The higher dividend was paid during the years 1901, 1902 and 1903.

The Pentecost Lumber Company have inaugurated extensive plans to supply the pulp and paper mills of Northern New York with pulp wood from their timber limits in Quebec. Cape Vincent, N.Y., has been made the receiving point, and storage ground for 10,000 cords of wood has been acquired. The wood will be taken from the ships by conveyors, operated by electricity.

THE FIRST SAW MILL IN NEW BRUNSWICK.

W. O. Raymond, L. L. D., writing in the St. John Telegraph on "Early History of New Brunswick Families," says concerning the first saw mill in New Brunswick:

"The reference to a mill, built by the brothers Louis and Mathieu d'Amours in the neighborhood of Fort Nashwaak, may serve to explain the statement of Villebon in 1696, that he had caused planks for madriers, or gun platforms, to be made near the fort. This mill at any rate ante-dates by the best part of a century the mill built by Simonds & White at St. John in 1767 and that built by Colonel Beamsley Glasier's mill-wrights at the Nashwaak in 1768. Doubtless it was a very primitive affair, but it sawed lumber, and was in its modest way the pioneer of the greatest manufacturing industry of New Brunswick at the present day."

COLORING WOOD IN THE LOG.

A new Swedish method of coloring wood clear through, and while in the log, is thus described by the Timber Trades Journal of London: "All the sap is expelled and the log is then treated with chemicals, and the color or colors are pressed into the wood. Any shade desired can be obtained, and, in fact, several colors can be merged one into the other, producing a beautiful effect. On cutting up the samples we received, we found that the color was evenly distributed all through the fibers, the grain of the wood giving a very pleasing effect, especially when polished. The wood, it is claimed, dries sooner than by ordinary seasoning, and it can also be rendered fireproof by adding special chemicals. Of course, painting is done away with, so that the natural structure of the wood is seen to better advantage than when painted in the ordinary way. The coloring is, we understand, free from arsenic and quite harmless. The colors do not fade, and cannot be worn off by rubbing, etc."

REMOVAL NOTICE.

On the first of November, 1904, the Winnipeg office of this Journal will be removed to the new Union Bank Building. This building, which is just nearing completion, is thoroughly fireproof and in construction and equipment is the equal of any on the continent.

A standing invitation is given readers and friends of the Journal to call when in Winnipeg. Any possible information or assistance will be gladly furnished them.

A BRAND NEW DESIGN IN

BAIL PULLS

(No. 1569)

If you use these goods it will pay you to write us for sample and prices—and for Circular No. 1381.

WE ARE AGENTS FOR THE CELEBRATED

MARTIN CASTERS

which are without question the BEST CASTERS MADE.

The No. 2, as illustration, is for furniture and general use, with capacity of 250 pounds. The No. 10 Truck Caster has capacity of 2,500 pounds. They are also made to carry 5,000 pounds.

Hardware, Tools and Supplies

NEW YORK CITY, Since 1848

New Home After October: 4th Ave. and 13th St.

MACHINERY HALL AT THE CANADIAN NATIONAL EXHIBITION, TORONTO.

Upwards of fifty exhibitors were located in the Machinery Hall at the recent National Exposition in Toronto. Taken as a whole, the exhibit in this building was, without doubt, superior to that of any previous year both in point of general attractiveness and the variety of manufactures shown. The accompanying panoramic view will give the reader some idea of the character of the exhibits as well as of the general appearance of the building.

The most extensive exhibit was that of the Canadian General Electric Company and the Canada Foundry Company. The latter company exhibited a line of the well-known Northey pumps, cast iron pipe and special castings, waterworks supplies, set screws, and other foundry products.

The Dodge Manufacturing Company, of Toronto, had a very interesting exhibit of power transmission appliances. The shafting shown was fitted with the Dodge friction clutch and attracted much attention. Dodge wood split pulleys were shown in all sizes, besides a complete line of couplings, hangers, ring, chain, and capilliary self-oiling bearings, machine moulded iron pulleys, etc.

Four belting firms were represented in the Machinery Hall. The J. C. McLaren Belting Company, of Montreal and Toronto, showed a 36-inch 2-ply leather belt made for the Ingersoll Electric Light & Power Company; a 24-inch belt made for the electric light plant at Mitchell, Ont., and a 48-inch belt for the Firstbrook Box Company, of Toronto. The latter belt is to operate on a Reeves pulley, which was shown in the Manufacturers' Annex.

In the exhibit of D. K. McLaren, of Montreal, were to be seen leather belts of various sizes, made from oak-tanned leather, also belts made of a mixture of Batavia and rubber, for use in exposed places. English card clothing, cotton mill supplies, belt hooks, etc., were also shown.

The Dominion Belting Company, of Hamilton, showed a stitched cotton duck belt five feet wide, of their well-known "Maple Leaf" brand, also smaller belts down to 1½ inches wide. The duck from which this class of belting is made is treated with a special preparation which gives splendid results.

The Rossendale Belting Company, of Manchester, Eng., whose Canadian office is at 59-63 Front street east, Toronto, had an exhibit of their M. A. Y. solid woven, anti-friction edged belting and the Jackson patent belt fasteners.

A varied line of goods was shown by the Fairbanks Company, of Montreal. The list included their standard scales, asbestos disc valves, Thompson engine indicators, safety valves, Foster pressure regulating valves, steam gauges, gas and gasoline engines of horizontal and vertical types, Nicholson's patent compression couplings, ball and socket drop hammers, Fair wood split pulleys (made in Canada), compressed steel pulleys, Fair brand leather belting, Geipel steam traps, Burt exhaust heads, Warden oil filters and several other steam specialties.

The power for the main drives in the Machinery Hall was supplied by two Goldie & McCulloch engines, one being of the well-known Wheelock type, the other a high speed "Ideal" engine. The Goldie & McCulloch Company also showed a 12-inch 4-sided moulder, new style power feed cut-off saw, new 30-inch double surface planer, four-sided moulder and other machines.

The A. R. Williams Machinery Company, of Toronto, had a good display of iron and wood working machinery, including a special machine for the manufacture of veneer. A number of circular saws made by the well-known firm of the E. R. Burns Saw Company, Toronto, were also on exhibition.

Babbitt metal comprised the main feature of the exhibit of the Syracuse Smelting Works, of Montreal. Their Manganese anti-friction metal is claimed to have no superior. Specimens of copper ore and the refined product were shown by their associate company, the Montreal Copper Company, who were the first in Canada to produce refined ingot copper.

Kerr & Goodwin, of Brantford, Ont., had a very fine exhibit of the "Imperial" lathe chuck, and G. S. Sinclair & Sons, of Wiarton, Ont., exhibited Sinclair's patent shaft coupler for the

VIEW OF THE EXHIBITS IN THE MACHINERY HALL AT THE CANA

transmission of power, the salient features of which are claimed to be safety, no bolts, no keys, never slips.

A new exhibitor this year was the Georgian Bay Engineering Works, of Midland, Ont. Their display was confined to a 4 h. p. gasoline engine, of simple construction but fully guaranteed. They manufacture stationary, portable and marine gasoline engines for all purposes, automatic towing machines, mine hoists and contractors' plant, and intend this winter to take up the manufacture of steel launches.

Another new exhibitor was the Smart-Turner Machine Company, of Hamilton, who showed steam pumps and gasoline engines from 1½ horse power upwards, also the Rodgers shaking grate, which is claimed to be a great fuel saver and to accomplish splendid results with slack coal.

The Eureka Mineral Wool Company, of Toronto, utilized a considerable portion of their space to demonstrate the advantages of "Cling Surface" belt dressing, of which they are making a specialty. When treated with this dressing the friction of a belt is greatly reduced and the incidental expenses decreased. Mineral wool pipe covering, Daniels' perfect pistol packing, Florian fireproof deadening felt and Paroid roofing were among the other articles exhibited by this company.

The Philip Carey Manufacturing Company, 100 Front street east, Toronto, showed standard asbestos pipe covering, Magnesia flexible cement roofing, asbestos sheeting, etc.

BUREAU OF FORESTRY CLASSIFICATION.

On July first the Bureau of Forestry put into effect a new classification or grading of government employees in the Department of Forestry, Washington. The following shows the grades and salaries :

Forester, $3,500.

Associate Forester, $2,700-$3,000.—Chief of the ranking division and assistant to the forester.

Assistant forester, $2,100-$2,600.—Chiefs of divisions and men occupying positions of similar responsibility.

Forest Inspector, $1,800-$2,000.—Chiefs of the ranking sections of divisions and men in charge of independent lines of work of similar importance.

Assistant Forest Inspector, $1,500-$1,700.—Chiefs of sections of divisions, except of the ranking section, and men occupying positions of similar responsibility.

Forest Assistant, $900-$1,400.—Men who enter the Bureau through the examination for forest assistant and have not yet been given charge of independent lines of work.

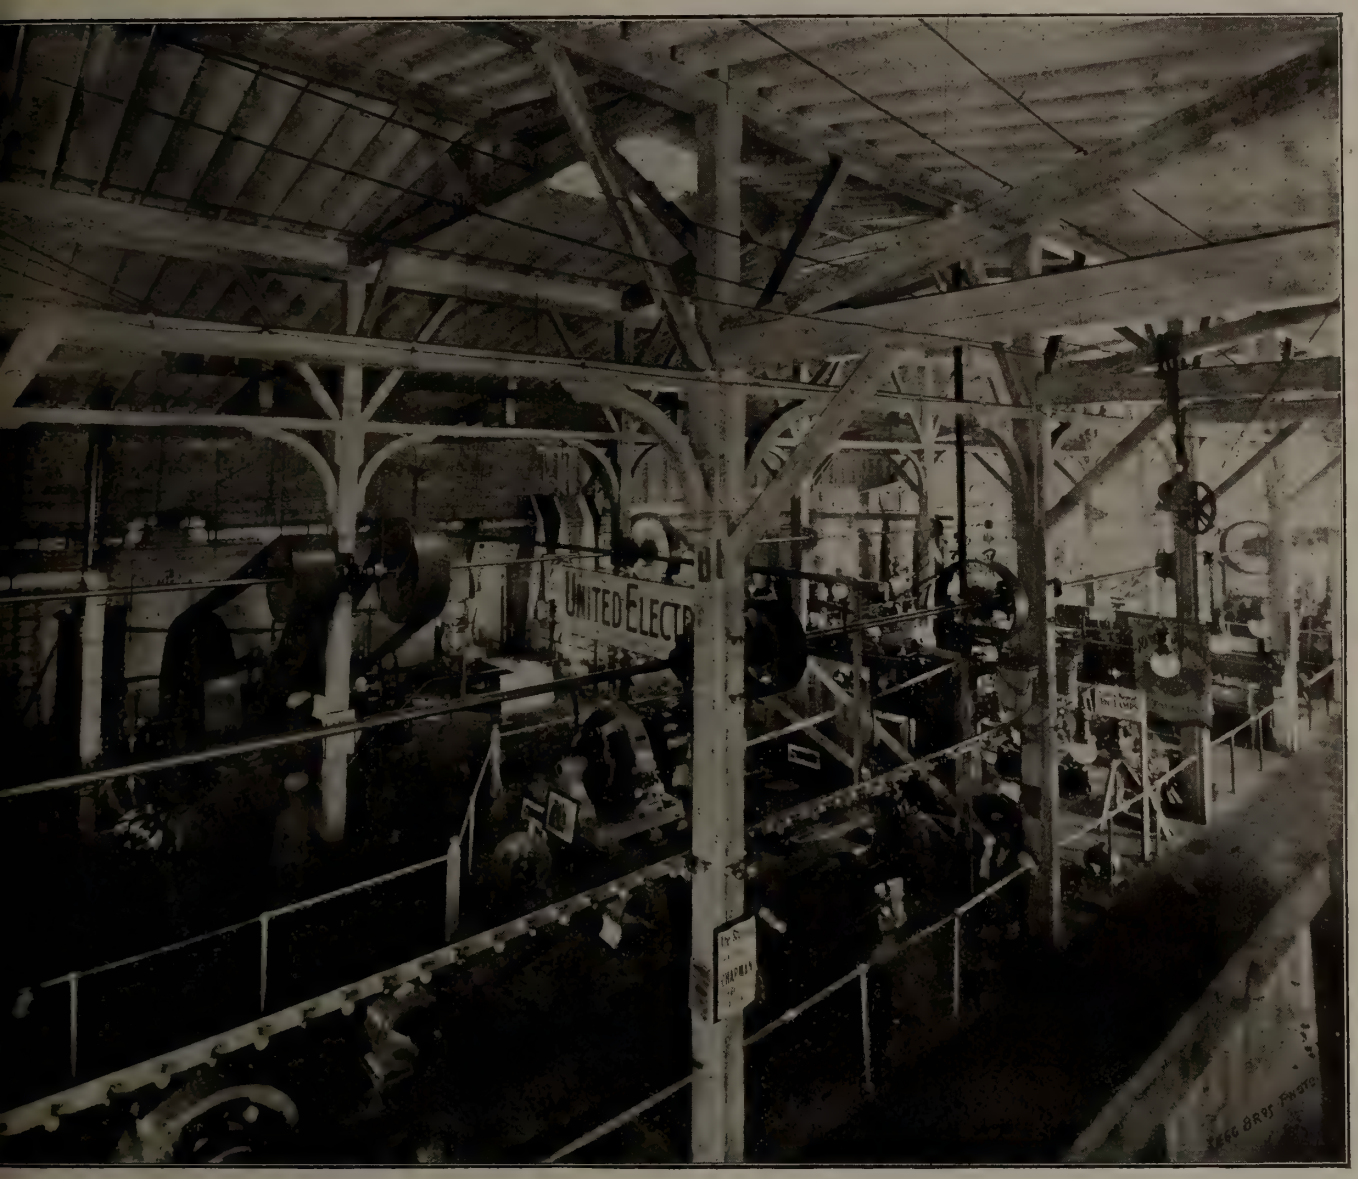
Forest Agent, $700-$900.—Men without civil service standing, in charge of subordinate lines of work.

Forest Student, $300.—Men whose service is temporary and educational in character and whose training in forestry is incomplete.

It will be seen from above that this field is an attractive one for young men.

NEW SAW FACTORY.

The new saw factory of the A.J. Burton Saw Company at Vancouver, B. C., has been completed and was thrown open for inspection on Friday, September 16th. The factory is a large two-story frame building, situted at corner Powell street and McLean drive, and is fitted up with modern machinery. The company import the saw steel in circular plates, and which has previously been rolled in the mills to the desired gauge, from Sheffield, Eng. They claim that the eastern saws are too soft for the British Columbia trade, and it is the intention to supply an article which will meet the local requirements in every respect. The officers of the company are : President, Mr. Robert Jardine ; vice-president, Dr. E. Sawyer ; manager, Mr. A.J. Burton; secretary-treasurer, Mr. H. Wilkinson.



AL EXHIBITION, TORONTO, AUGUST 28 TO SEPTEMBER 10, 1904.

IMPORTANT FORESTRY WORK.

Prof. Zavitz, who is in charge of forestry work at the Guelph Agricultural College, intends to take energetic action in the direction of farm forestry. He has recently completed a tour of Ontario with the object of finding out what are the farm forestry conditions, the needs and capabilities of the different sections. He found the Lake Simcoe and Georgian Bay districts well adapted for experiments in farm forestry. He proposes to set out at once on a seed collecting expedition, a heavy crop of white pine seed being promised this year.

THE Wood-Worker and Retailer

AMERICAN NO. 2 SELF-FEED RIP SAW.

An examination of the accompanying cut will convince our readers without any extenuated remarks of ours that this late and improved machine recently brought out by the American Wood Working Machinery Company is a winner. It is designed for ripping all grades of stock up to 25 inches wide and 6 inches thick.

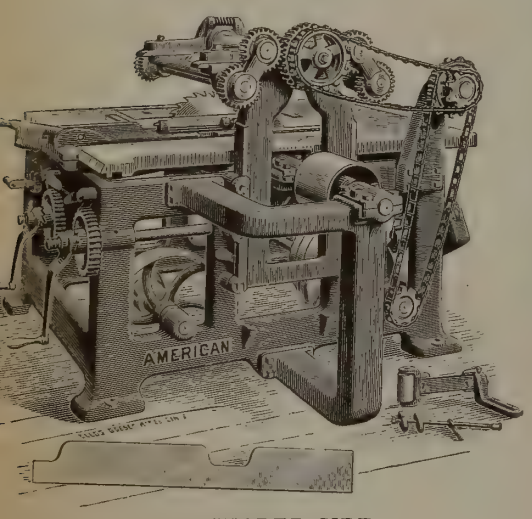
The table is 40 inches wide by 55 inches long, having two idler rolls in the bed and a throat plate. The arbor is extended so that two or more saws can be used at the same time, the extreme distance between the saws being 6½ inches. If the operator so desires he can place a saw against the outside collar next to the nut, which will permit the ripping of stock 31 inches in width.

An improved seif-locking gauge is furnished with each machine. It is extremely simple in its construction, easy to operate and yet is held firmly in any position, allowing of accurate work to be accomplished.

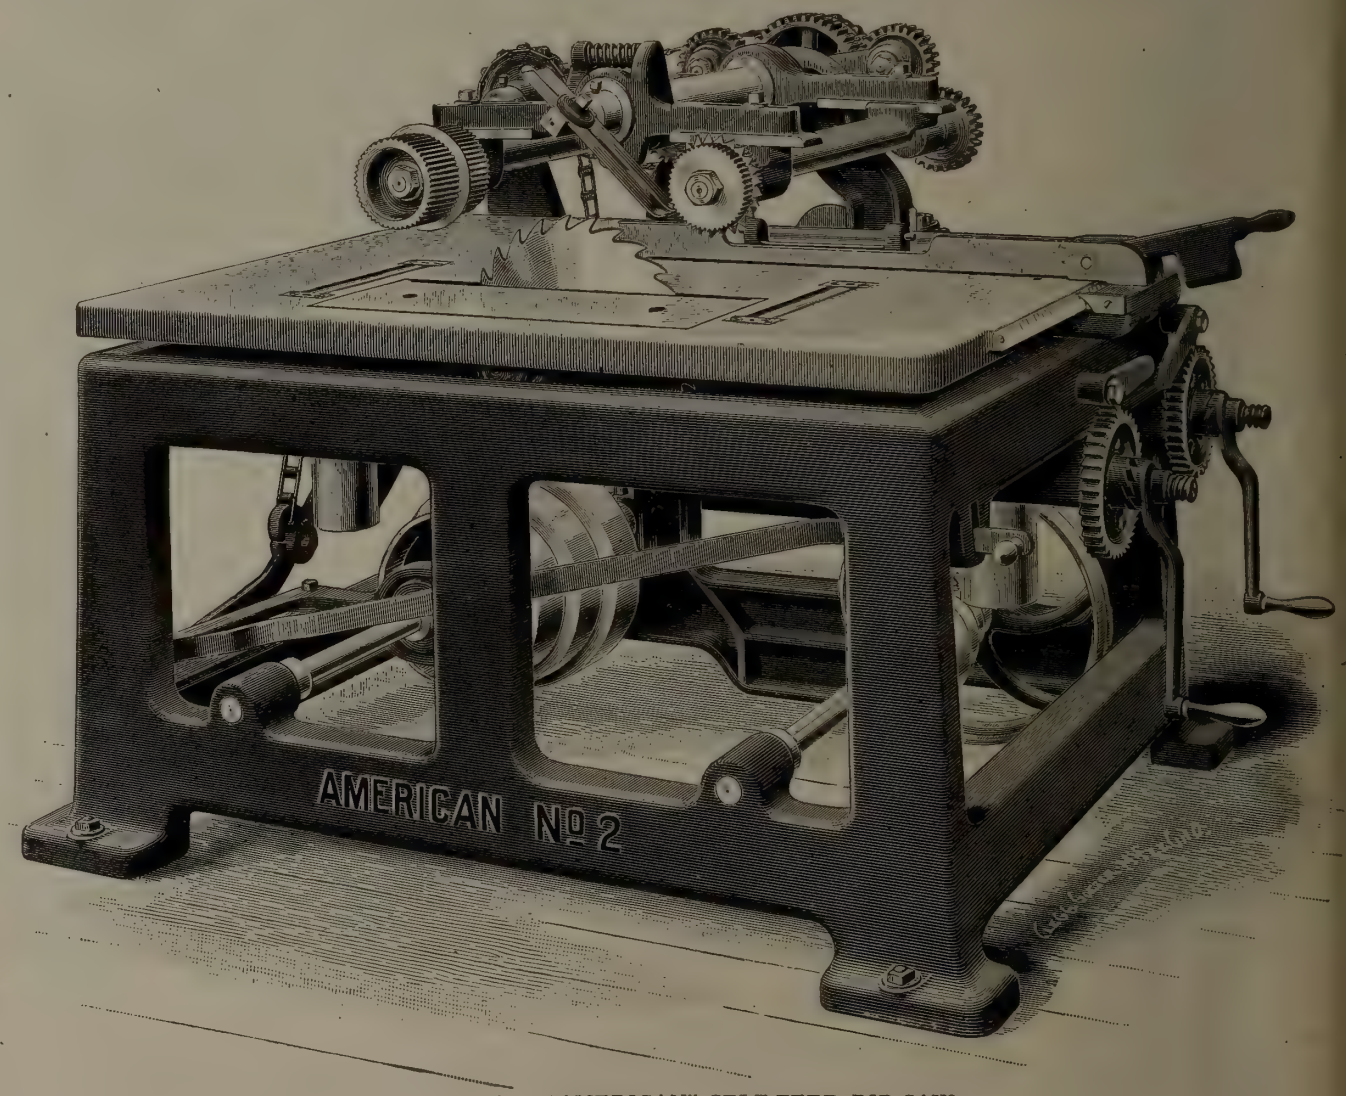
The feed is strong and powerful. It is also adjustable so that when a 10-inch saw is used it can be moved close to it so as to hold the lumber firmly and can be expanded so as to take in a 20-inch saw.

The manufacturers have used special care in designing and constructing this machine, and believe that it is superior in every part to any similar machine now on the market.

To any one interested, we would advise their taking up the matter with the American Wood Working Machinery Company, 136 Liberty Street, New York City, or the Fairbanks Company, Vancouver, B.C.



GEARED SIDE.



NO 2 "AMERICAN" SELF-FEED RIP SAW.

HEATING A PLANING MILL.

A correspondent asks the publishers of The Woodworker as to the best method of heating a planing mill 60x80 feet. He wishes to use the exhaust steam from a 38 horse power engine. The following general directions are given and should be carefully followed :

Place a good separator in the exhaust pipe of your engine, so that all cylinder oil will be taken out of the exhaust steam and discharged into the sewer.

Carry the exhaust pipe to the middle of rear wall of your building, then extend it from cellar to roof, putting a back pressure valve near the ceiling of the second story. Weight this valve so that it will open at 3 pounds, to prevent back pressure from rising above this point.

Run a live steam pipe from your boilers to your exhaust pipe. Put a reducing valve in this pipe that will reduce the boiler pressure down to 2 pounds where the live steam discharges into the exhaust pipe. If you do not have enough exhaust steam to fill the heating pipes, the reducing valve will admit steam from the boilers to make up the deficiency.

On each floor provide an outlet the full size of exhaust pipe, then provide a T that will let one-half of the steam go in each direction. For illustration, suppose the exhaust pipe is 4 inches diameter. Then provide a 4-inch T for each storey .Screw a piece of 4-inch pipe into the outlet, followed by a 4-inch reducing T, the outlets from which are not less than 2½ nches. These will point toward the sides of mill and each one must be fitted with a valve.

Construct radiators of 1¼-inch pipe and locate them alongside walls near the floor, under windows, etc., having enough of them to heat the rooms in cold weather. We can not tell how much radiating surface this will require, as we are not acquainted with location of rooms and other conditions which call for more or less pipe surface. Probably one radiator consisting of four pipes, with another containing three pipes just above it, will answer your purpose, as you can then use either three, four or seven pipes according to the outside temperature.

Drips from all radiators or banks of pipes must discharge into a pipe at the other end of mill, and this pipe must lead to a receiver and duplex pump in the basement, which will pump all hot water back into the boilers without releasing it from pressure.

This arrangement of piping will enable you to shut steam off from the warm side of mill in mild weather, and keep it on the cold side. By judicious location of radiators and valves

FOR THE CAMP

We have a very suitable lot of goods for camp supplies. We make this kind of trade a specialty. You who are not getting suited just as well as you would like, try us for your next order, and give us a chance to demonstrate our ability to give you satisfaction in this very important department of your business.

H. P. ECKARDT & CO.

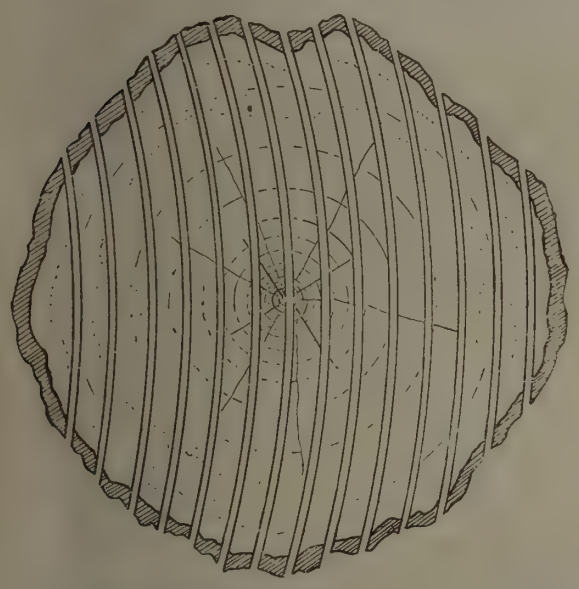
Wholesale Grocers - - TORONTO

you can secure a comfortable temperature at all times, without overheating. Raise the temperature to 60 degrees before your men begin work in the morning, while the doors and windows are shut.

If your mill has been poorly heated during past winters, the cost of fuel will be increased by the above described arrangement of piping, but you will profit by the better condition of mill for doing good work. Employ a competent heating engineer to arrange the details of this plan.

SLACK STAVES FROM CORDWOOD.

When the statements made by the Peter Gerlach Company, Cleveland Ohio, relative to the making of slack-barrel staves by the aid of



Showing how Slack Staves are made by Gerlach Process.

a cylinder saw, as they are found below, are considered, it is almost startling and is bound to attract very wide attention, says the National Cooper's Journal. The illustration tells its own story, but the statements below will well repay careful reading.

From a 6½-inch bolt when cut upon a Gerlach 24 or 26-inch, we give you staves enough to make a barrel, as per diagram.

From a 5-foot cord of bolts, containing 160 C.F., we give you 2,000 slack-barrel staves, cut ⅜ inch thick.

One thousand feet of log will produce from 12,000 to 13,000 staves.

Our machinery will make good staves from small, round timber, running anywhere from 4 to 12 inches in diameter, at the same time large logs may be used, by simply cutting the logs into flitches about 4 inches in thickness, that is to say, a log about 3 feet in diameter would be cut into a flitch about 4 inches thick (other sizes of logs in like proportion) upon the bolting saw machine.

The small round bolts can be cut directly into staves without any previous bolting.

If large logs are used and cut into flitches as above mentioned, these flitches whether 6, 12, 18 or 24 inches wide may be cut directly into staves without any further preparation.

With our process of stave making any class or grade of timber may be used, thus if you were clearing up a patch of timber land, you would be able to utilize everything that grows, even to the limbs and tree tops.

This is very important, as saw mills use large timber only and usually leave from 20 to 50 per cent. of waste produce behind.

Saw mill slabs may likewise be worked into staves with our machinery.

With our machinery no steaming or cooking of machinery is required, and the staves make a tighter and better barrel, as well as dry quicker than knife-cut staves.

A Michigan stave and barrel maker using a Gerlach stave saw says: "In a run of seventy-three days with one new Gerlach stave machine, we cut 750,000 slack-barrel and 50,000 tight-barrel staves, and by using your eccentric lever swage we produced very smooth stock."

These staves were made from 14 different varieties of timber. In cutting the above quantity of staves, the saw was reduced 1½ inches in length.

If all tight-barrel staves, if all nail-keg staves, if all pail, tub and churn staves are made with cylinder-stave saws, why not all slack-barrel staves?

MODEL SASH AND DOOR PLANT.

The Wheeler-Osgoode Company, Tacoma, Wash., have constructed a wood-working plant without the employment of a single brace or beam upon which dust can collect. There are no bridge trees, platforms or braces of any sort on either floor of the building, thus doing away with a large element of fire risk as well as giving a maximum of light. The sides of the mill are almost entirely of glass.

Another peculiarity of this mill is the total absence of belt tighteners, while the belts themselves are all endless. The plant has a daily capacity of 1,000 doors and 400 windows, besides the usual proportion of mouldings, frames, and turned and cabinet work.

PUBLICATIONS.

Messrs. Sheldon & Sheldon, Galt, Ont., in a recen booklet, call attention to the apparatus used in the hot blast system of heating and point out some of the advantages which this system is claimed to possess over all others for a like class of work.

The Morton dry kiln is very fully described and illustrated in a booklet recently published by the A. H Andrews Company, Wabash ave., Chicago. This company have been drying lumber for their own use since 1865 and manufacturing dry kilns since 1882, and the Morton moist-air down draft kiln is the product of their own experience.

Messrs. Baldwin, Tuthill & Bolton, of Grand Rapids, Mich., announce the publication of their new catalogue for 1905, which is now ready for mailing. It contains 192 pages 6½ × 9 inches, handsomely bound and printed on enamel stock, with over 200 illustrations of saw and knife fitting machinery or kindred appliances fully described. This is the most complete publication of the kind that this firm have yet issued, and it will be mailed free of charge to any person interested in saw or knife fitting equipment.

The Finnish pulp manufacturers have completed arrangements with those in Sweden and Norway whereby the production of pulp will be lessened in all three countries, if considered desirable in the interests of the trade. The production last year (33,144 tons) was 50 per cent. above that for 1902.

The Brunette Saw Mill Company, Limited, of New Westminster, B.C., recently completed a new box factory having a capacity of 6,000 boxes per day. The equipment includes two dove-tail machines, manufactured by the Dove-Tail Machine Company, of St. Paul, Minn., said to be the only machines of the kind in use in the Canadian North-West. A box printing machine of the latest design has also been installed.

THE NEWS

ONTARIO.

—John Parker has recently completed a new planing mill at Sturgeon Falls, Ont.

—The Rainy River Lumber Company intend installing a box factory at Rainy River, Ont.

—Isaac Hiltz, employed in Bowes & Johnson's saw mill at Ashley, Ont., recently had his left hand amputated by an edger.

—The Conger Lumber Company, of Parry Sound, Ont., have commenced the erection of a stave factory on Moon River Bay.

—It is stated that the Thomson Lumber Company, of Goderich, Ont., are considering the building of a large saw mill at Wiarton.

—The Canadian Cooperage Manufacturing Company have made a proposition to the town council of Carleton Place, Ont., to establish a cooperage stock mill in that town.

—D. Aitcheson & Company, of Hamilton, Ont., have purchased a water power at Magnetawan, where they will build a saw mill to manufacture principally birch and hemlock.

—It is stated that Maitland, Rixon & Company, of Owen Sound, Ont., contemplate the erection of a large saw mill on Lake Manitou, about four miles from Manitowaning.

—The Department of Railways and Canals are building a woodworking machine shop at Cornwall, Ont., for the manufacture of lock gates and furnishings for the canals on the Upper St. Lawrence.

—The men employed in the saw mill and new pulp mill of J. R. Booth at Ottawa number 1,700, and the fortnightly pay roll amounts to $23,000. The Booth system of railways employs 3,500 men, who draw in wages $90,000 per month.

—P. Shannon, lumberman, of Pembroke, is constructing a lift lock to connect Lake Ramsay with Lake Biscotasing. The lift will be about fifteen feet and is being constructed to avoid the necessity of portaging lumber supplies from one lake to another.

—A. W. Davidson, formerly manager of the Windsor Turned Goods Company, Windsor, Ont., has formed a new company in Detroit for the manufacture of wooden turned goods. A McClure, of the McClure Lumber Company, Detroit, is also interested. The factory will be located somewhere in Michigan.

—An Ontario charter has been granted to the Norman Box Company, Limited, of Rat Portage, Ont., the capital stock being $25,000. The directors are: L. R. Mackey, William McKinnon, John Glenn, of Keewatin; Hugh Armstrong, of Portage La Prairie; and Arthur Johnson, of Rat Portage.

—The Scott & Hudson Building Company have made considerable improvements to their plant at Fort William, Ont., having installed a 30 h.p. Westinghouse electric motor, a new moulding machine, sticker, and sander. They are now in a position to do a large trade in sash, doors, etc.

—Samuel Morrison, of Owen Sound, was drowned at that place on September 19th by slipping off a raft of logs. Deceased had for fifteen years been engaged in rafting, and was an expert raftsman. Until a year ago he was employed with Maitland, Rixon & Company and since then with the John Harrison & Sons Company.

—The W. J. Pulling Lumber Company, of Windsor, Ont., have issued a writ against the McAllister Bros. Lumber Company, of Cockburn Island, claiming $10,000 for breach of contract. The Pulling Company claim that they contracted with E. Berge, agent for McAllister Bros., for 130,000 ties at twenty-nine cents each, but McAllister Bros. failed to carry out the contract on the ground that their agent was not authorized to make such a transaction.

—The lumbermen of the Ottawa Valley district are taking steps to increase the flow of the Ottawa river and provide a greater volume for periods of low water. It is proposed to dam the northern outlet of Long Lake, a body of water 200 miles long which empties into Hudson's Bay, and to divert the water in a southerly direction into the Ottawa river. It is further planned to build a series of retaining dams lower down the river to hold back the water in the seasons of plenty.

—The Turner Lumber Company, of Midland, Ont., with other lumbermen, have suffered considerably by "jumpers" and vigorous steps are being taken to put a stop to such practises. Recently the Turner Company hired some men near Tweed, Ont., and advanced them their railway fare to South River. Five of them "jumped" after working a day. The company solicited the aid of the district officials, with the result that one of the men was caught and taken to Burk's Falls, where he was sentenced to ninety days' hard labor by the police magistrate.

THE EASTERN PROVINCES.

—Kaine & Reynolds have registered as lumber dealers at Quebec, Que.

—The firm of A. E. Clint & Co., Quebec, Que., is announced to have been dissolved.

—Rivard & Freerer have registered at Fortierville, Que., as manufactures of shingles, etc.

—The Fox River Lumber Company, of Parrsboro, N.S., are building a schooner of 400 tons register for Captain W. F. Conlon.

—H McIsaacs, a young man employed in Murray & Gregory's saw mill at St. John, N.B., had his right arm so badly lacerated by a saw that amputation was necessary.

—The Eastern Townships Furniture Manufacturing Company has been incorporated by the Quebec Government, to manufacture furniture, lumber, etc., and deal in timber limits. The incorporators include Theodore Savoie, manufacturer, of Plessisville, and J. E. Perrault, advocate, of Arthabaska.

—Clarke Bros., lumber operators at Bear River, N.S., cut last year 10,000,000 feet of lumber, three-quarters of which was spruce and the rest pine and hemlock. The entire cut was shipped to Cuban and South American ports.

—Nathaniel Curry, N. A. Rhodes and Charles T. Hillson, lumbermen, of Amherst, N.S., and others, have been incorporated as the Canada Rolling Stock Company, Limited, with a capital of $250,000 and head office at Amherst. It is proposed to manufacture locomotives, rolling stock, etc.

—The Moncton Wood-Working Company, Limited, of Moncton, N.B., has been incorporated, with a capital stock of $8,000. It is proposed to acquire the wood-working business carried on at that place by Bishop, Leger & Company, while the charter gives the company the privilege of conducting a general lumber business and acquiring and developing water powers. The incorporators include C. W. Dobson, lumberman, of Weldon, N.B.

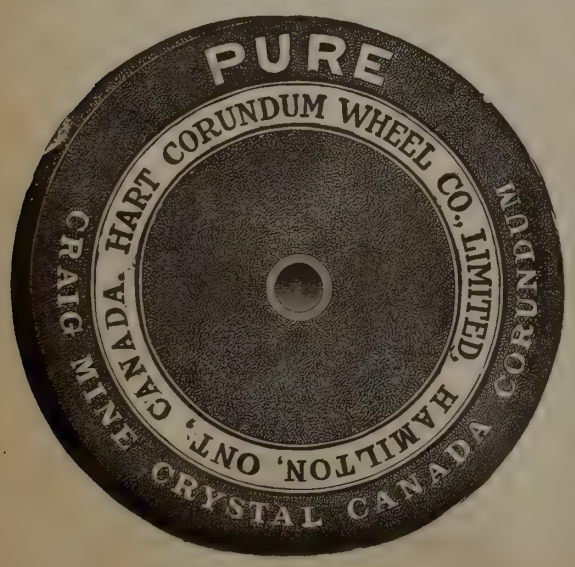
—The capacity of Clarke Brothers' mill at Lake Jolie, near Bear River, N.S., has been almost doubled since 1900. It now stands at 65,000 feet in deals or 45,000 feet in boards per day of ten hours. Additions and improvements to the plant and equipment have been installed in the form of two new planers, a rip saw, trimmer, stock gang and a dry kiln. The firm have lately purchased a new property at Kennet Cook, Hants County, N.S.

—The Moreau's Barking Machine Company has been incorporated by the Quebec Government, with a capital of $40,000 and head office in Montreal. It is proposed to acquire the patents of invention granted to Joseph Moreau, of St. Germain of Grantham, Que., for improvements in bark removing machines, and to manufacture such machines. The promoters include O. W. Nordin, lumber merchant, and A. Nordin, lumber superintendent, of Rosebank, N.B., and Ovide Brouillard, lumber merchant, of Carmel, Que.

—About two years ago Easton Bros., of Albany, N.Y., purchased a tract of timber land in Saguenay county, Quebec Province, running four miles on each side of the Portneuf river for about fifty miles north, the whole comprising four hundred square miles. They have since built a saw mill having a capacity of about 8,000,000 feet of lumber a year. Last month the business was incorporated under the name of C. P. Easton & Company, with a capital stock of $300,000, the directors being William Easton, Frederick Easton, Irving B. Easton, Alice E. Pray (nee Easton), and Ledyard Cogswell, the latter being president of the New York State National Bank, Albany. The head office of the company is in Quebec city.

—The Gaspereaux Lumber Company, of Halifax, N.S., which was organized about a year ago, are conducting lumbering operations near Kentville, N.S., where they possess 4,500 acres of first-class timber land, consisting largely of spruce interspersed with

CRAIG MINE CRYSTAL CORUNDUM WHEELS



Our Pure Crystal Corundum Saw Gummers have no equal for their rapid, cool, cutting properties.

Read the following from Bulletin 180 of the United States Geological Survey, which says:

"Often a distinction is made between emery and corundum, many persons not recognizing emery as a variety of corundum.

Emery is a mechanical admixture of corundum and magnetite or hematite. It is, of course, the presence of corundum in the emery that gives to it its abrasive qualities and makes it of commercial value, and the abrasive efficiency of emeries varies according to the percentage of corundum they contain."

Emery is imported, mined by Greeks and Turks and contains only about 25% corundum. Our Crystal Corundum is guaranteed to be 98% pure alumina, a Canadian product, mined and manufactured by Canadians for Canadians.

HART CORUNDUM WHEEL COMPANY, Limited, Hamilton, Ont., Can.

birch. The company possess a very valuable water power, at which a head of over 600 feet above the sea level may be obtained, while in addition to this they have purchased valuable franchises for supplying power and lighting to several nearby towns. The possibilities of the property can easily be understood by the reader when it is known that the water power is only 71 miles from Halifax, making it possible for the company to supply Halifax with its electric power, providing such can be accomplished at a sufficiently low figure, and also hastening the development of the valuable pulp areas the company possess. Mr. Patton, the well-known lumberman of Albany, New York, is president of the company, and while the company are not conducting very extensive lumbering operations at present, the lumbering public can rest assured that under the able leadership of Mr. Patton, who is also developing properties in the interior of Newfoundland, the company's operations will very soon represent a large figure in the lumber industry of Nova Scotia. Mr. Henderson, of Halifax, is the local manager of the company.

MANITOBA AND THE TERRITORIES.

—W. H. Clark & Company have built a new sash and door factory at Edmonton, N.W.T.

—Ross Bros., lumber manufacturers, Whitemouth, Man., are making improvements to their saw and planing mills.

—Capt. William Robertson has made improvements to his saw mill at Selkirk, Man., which will increase the output considerably.

—The Canadian Lumber Company have decided to establish a lumber yard at Winkler, N.W.T., with J. R. Dyck as local manager.

—The John Arbuthnot Lumber Company have sold their lumber yard at Minto, Man., to the Canadian Elevator Company, Limited.

—Zink & Sutherland, of Brandon, Man., have been inspecting timber limits in the vicinity of Shuswap, B.C., with a view to investment.

—W. H. Armstrong, of Meltort, N.W.T., has sold his mill and timber limits at Crooked River to the Saskatchewan Valley Lumber Company.

—The longest piece of timber which has ever reached Winnipeg was brought in from British Columbia recently by the Sprague Lumber Company. It was British Columbia fir and measured 87 feet in length, 12 inches square at the base and 7 inches at the top, and has been erected as a flag pole on top of the new Union Bank building. The top of the pole is 226 feet from the ground, the building being eleven stories high.

BRITISH COLUMBIA.

—Clarke & Lee, of Alberta, B.C., are making large shipments of lumber to Manitoba and the Territories.

—The British Columbia Box Company, Limited, Vancouver, B.C., was incorporated last month, with a capital of $25,000.

—The Hazelmere shingle mill at Hall's Prairie, B.C., has been purchased by Wright & Son, of Everett, Wash., who are making extensive improvements to the plant.

—F. J. Wood, of the E. K. Wood Company, Bellingham Bay, Wash., is said to be considering the erection of a large saw mill at Nanaimo, B.C.

—The saw mill business of J. D. Sinclair, Vancouver, B.C., is announced to have been acquired by the British Columbia Box & Lumber Company, Limited.

—Incorporation has been granted to the Royal Lumber Company, Limited, of Victoria, B.C., with a capital of $500,000. Authority is given to conduct a general lumber business.

—Lester David, one of the purchasers of the Ross-McLaren saw mills at Millside, near New Westminster, B.C., is now making improvements preparatory to operating the mills.

—The new saw mill erected at Victoria, B.C., by Lemon & Gonnason was started on August 22nd and worked satisfactorily. The mill has a capacity of 20,000 feet of lumber per day.

—The Porto Rico Lumber Company, of Ymir, B.C., have opened up a new camp at Porto Rico siding and are also building another dam on the river to be used in flooding and bringing the logs to the mill at Ymir.

—The Klondike saw mills at Dawson, Yukon Territory, owned by the North American Trading & Transportation Company, were completely destroyed by fire on September 6th, the loss being $75,000, with no insurance.

—The North Pacific Lumber Company, Port Moody, B.C., expect to have their new mill completed at an early date. The main building is 60 × 130 feet and two stories high. It is built parallel with the shore and set out in the bay 100 feet further than the old mill.

—The firm of Wardrope Bros. & Nelson, whose mill at Sparwood, B.C., was destroyed by fire a while ago, has secured an adjustment of the loss from the C.P.R. The origin of the fire was said to have been due to a spark from the engine, and the blaze was traced from the side of the track. The loss was $13,600.

—Magistrate Pittendrigh, of Vancouver, B.C., recently imposed a sentence that should act as a deterrent against the pursuit of the bush fire habit. A fine of $200 or six months' imprisonment with hard labor was imposed upon a Chinaman named Sam who was convicted of having set a bush fire in Hastings.

—The Orillia Packet says that at a recent meeting of the Ontario-Slocan Lumber Company held in that town, it was decided that Messrs. J. B. Tudhope, M.P.P., J. H. Lavallee and Thomas Chew should visit British Columbia shortly for the purpose of making arrangements for the erection of a large saw mill at Slocan.

—The saw mill of the King Lumber Company, of Cranbrook, B.C., which was destroyed by fire about the middle of September, was owned by Senator King, of Chipman, N.B., and his sons, Dr. King, M.P.P. for Cranbrook, and M. B. King, the latter being the manager. A few years ago they acquired timber limits and built two mills, one of which is still in operation.

—A wide charter has been granted to the Export Lumber & Shingle Company, Limited, recently incorporated at Victoria, B.C., with a capital of $50,000. The company is authorized to acquire timber limits, build ships, saw mills, shingle mills, etc., and manufacture and deal in lumber, shingles and other timber products.

—The loggers on the British Columbia coast have been hampered this year by a lack of water supply for their donkey engines. The summer has been very dry, the pools of water in the woods have dried up, and as a consequence several logging camps have had to close down. Forest fires have also been a great handicap to operations in the woods.

—It is reported that Senator McLaren has entered suit against the Canadian Pacific Railway Company for $125,000 damages as a result of the forest fires of the past few months in British Columbia. His extensive timber limits in the Crows Nest district were almost totally destroyed, and it is alleged that the fires were started by sparks from the C.P.R. locomotives.

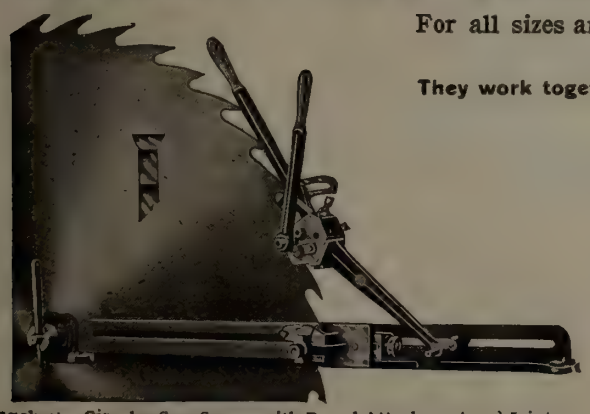
—P. J. Cahill is reported to have made money out of timber limits in the East Kootenay district of British Columbia. The Moyie Leader says that Mr. Cahill has been one of the most successful timber speculators in the Kootenay. He went to Moyie six years ago and lost no time in controlling miles of the choicest timber in the district, with the result that he is now wealthy.

—The saw mill at Vancouver, B.C., formerly known as the Leamy & Kyle property, but recently operated by the Vancouver Lumber Company, has been purchased by Texas capitalists, including A. L. Clarke, of Tyler, Texas. It is believed that nearly $100,000 was paid for the property. The business will continue to be operated under the name of the Vancouver Lumber Company, and it is said that the purchasers intend acquiring additional timber limits.

—The act regulating the measurement of timber in British Columbia now applies to the territory east of the Cascades. When it was passed in 1902 it was intended only for the territory west. The timber sold to a company is to be measured by an employee of the company, and the amendment is sought that if an appeal is made the supervisor's fees are to be made by the loser. Scalers are now required to pay a fee of $25, which is considered unnecessary and unjust. The extension of territory will be welcomed.

—The Kamloops Saw Mills, Limited, were particularly unfortunate in having their saw mill at Kamloops, B.C., destroyed by fire on September 9th. The mill was built three years ago by Peter Ryan and John Shields and was bought by the Kamloops Saw Mills about a year ago. It contained modern equipment, all the machinery being supplied by the Waterous Engine Works Company, of Brantford, Ont. A planing mill was attached, fitted up with four planers made by McGregor, Gourlay & Company, of Galt, Ont. The loss by the fire is estimated at $50,000, partially covered by insurance. The company have still two mills, one a saw mill at Enderby, in the Okanagan district, and the other a shingle mill at Annes, on the main line of the C.P.R.

THE HANCHETT SAW SWAGE AND SWAGE SHAPERS



Hanchett Circular Saw Swage with Ben chAttachment and Jointer.

For all sizes and kinds of Saws, Circulars, Bands, Band Resaw, and Gang Saw.

They work together. They give the saw teeth proper clearance.

After the saw has been swaged remove the saw swage from the pin and place the Shaper thereon.

The adjustment is made from the point of the tooth, hence every tooth is made exactly alike—widest at extreme points, widest on face, no matter what the irregularity of spacing, pitch, etc. We are always glad to send our machines out on approval guaranteed to please, if not satisfactory return at our expense. A trial will cost you nothing.

Write for circular "F" to

Hanchett Swage Works, Big Rapids, Mich., U.S.A.

Hanchett Swages do Good Work.

Hanchett Circular Swage Shaper with Bench Attachment.

TRADE NOTES.

The Syracuse Smelting Works of Montreal advise us that they are always open to purchase lead or copper concentrates.

Alfred Rubbra, of the Machinery Exchange, Montreal, has secured the agency for Clark & Demill, manufacturers of wood-working machinery, Galt, Ont.

The Huntsville Foundry & Implement Company are building a foundry at Huntsville, Ont., and will make a specialty of the manufacture and repair of saw mill machinery.

The Western Cordage Company, Limited, has been incorporated at London, Ont., with a capital stock of $300,000, to manufacture binder twine, rope, and all kinds of cordage. The president is Thomas H. Purdom, K.C., and the secretary E. B. Stone.

John McLean, an employee of the Canada Shingle Company, Vancouver, B. C., has received a Canadian patent on an improved tooth for a cut-off saw. The tooth is said to be more easily manufactured than any other on the market and to maintain its cutting edge for a longer time, with a minimum of side friction. L. G. McKam, of New Westminster, has acquired an interest in the patent.

The Oxford Foundry and Machine Company, of Oxford, N.S., have supplied the Grand River Lumber and Pulp Company, at Gillisport, Labrador, with one of Killam's double patent saw-beds, together with one of their carriages built with setter and dogger to ride on the carriage, for which Mr. Killam guarantees a record cut of 500 feet a minute or an average of 25,000 feet per hour. The mill has already been set up and is now at work.

The New Century Refrigerator & Manufacturing Company, Limited, of Dundas, Ont., have their large new factory completed and in full operation. It is splendidly equipped with the best and most modern machinery and systematized so as to reduce the amount of labor to the minimum, and is one of the most complete wood-working factories in Canada. There are large and extensive dry kilns by means of which all lumber will be thoroughly seasoned before being manufactured. The company will make a specialty of hardwood veneer doors with built-up bodies, which they claim are unshrinkable and are guaranteed not to warp or twist. They are made in modern designs, artistic in appearance and equal in construction and finish to any door on the market. They will also give close attention to architects' special designs of doors and trims. Agents will immediately be appointed in the different districts, and they will doubtless find their products a profitable line of goods to handle.

Some time ago we mentioned that experiments were being made regarding the production of ingot copper and bronze by the Syracuse Smelting Works, of Montreal. Since that time we understand the work has steadily proceeded and that recently a company has been incorporated to prosecute this industry entirely. It is to be called the Montreal Copper Company, Limited, and will be devoted to the production of ingot copper, phosphor copper, and phosphor bronze ingots. It is interesting to note that this is the first company of its kind in Canada, all copper mined in Canada and smelted into "Math" being usually sent to the United States to be refined. The company at the present time have a capacity of eight tons per day, which has proved quite inadequate for the demand. The object of the recent corporation is to provide the necessary capital for materially increasing the capacity. The officers are Mr. H. Sapery, president; Mr. L. Sapery, manager; Mr. Fritz Bornholdz, secretary-treasurer. The company was incorporated with a capital of $150,000, but it is intended to increase it to $250,000.

PERSONAL.

Mr. S. K. Grantham, who has operated a saw mill at Guysborough, Ont., for a number of years, died last month.

Mr. F. A. Sine has succeeded Mr. C. McCleary as secretary-treasurer of the Empire Lumber Company, Revelstoke, B.C.

Mr. George McCormick, M. P., Kamloops, B. C., fractured some ribs as a result of stepping on a loose plank on the loading platform of the company's mill.

Mr. E. G. Blackwell, formerly with Messrs. J. R. Booth & Co., of Ottawa, has been appointed manager of the Maniconagan and English Bay Export Co., Quebec.

Mr. Fred W. H. Jacomb, M. A., city editor of The Mercury, Guelph, Ont., has resigned his position to take a course in forestry at Yale Forest School, New Haven, Conn. It is his intention to follow forestry as a business.

Mr. C. McRae, managing director of the Alberta Lumber Company, Vancouver, B. C., was in the east recently for several days on a business trip, and was a welcome caller at the CANADA LUMBERMAN office. His company make a specialty of rough and dressed cedar lumber.

Mr. P. M. Thompson, who has been in the employ of the W. W. Johnson Lumber Company, of Minneapolis, for the last seven years as travelling salesman, has accepted a similar position with the Empire Lumber Company, of Revelstoke, B.C.

Mr. E. G McCormick, jr., has been appointed manager of the shingle mill of the Kamloops Lumber Company at Annis B.C., and Mr. John Shields, formerly manager of that mill, has been appointed to take charge of the company's offices at Enderby.

Mr. Finger has resigned the management of the Pigeon River Lumber Company, Port Arthur, Ont., although still retaining an interest in the company. Having superintended the building of the mill, which is now in successful operation, he desires to devote more time to his personal affairs.

A dispatch from Regina, N. W. T., dated September 26th, announced the death, under exceptionally sad circumstances, of Mr. J. S. Kerr, representative in the Territories for the North Pacific Lumber Company, of Barnet, B. C. Mr. Kerr was ill at the Windsor Hotel with typhoid fever and while delirious made his way to the reservoir, about one mile from the hotel, and drowned himself.

Mr. J. M. Ferguson, of Framantle, Australia, is at present in British Columbia for the purpose of investigating lumbering methods is that province. Mr. Ferguson, who is the head of a large lumber firm, states that he is greatly impressed with the modern methods prevailing in the lumber industry in Canada. In West Australia they still use horses and bullocks to draw timber out of the woods, but Mr. Ferguson believes that donkey engines, as in British Columbia, could be introduced with advantage.

In All Saints church, Ottawa, on Thursday, September 15th, a very fashionable wedding took place, the contracting parties being Mr. D. Boyce Sprague, buyer for the D. E. Sprague Lumber Company, of Winnipeg, and Miss Bonnie Simpson, of Ottawa, niece of Senator Simpson, of Bowmanville. The ceremony was performed by Rev. A. W. Mackay. The bride's cousin, Miss Muriel Jordan, of Buffalo, was maid of honor, and Miss Dorothy Simpson, another cousin, flower girl. The groom was supported by his cousin, Mr. Harold C. Sprague, of Winnipeg. A reception was afterwards held at the residence of Mr. Alex. Simpson, uncle of the bride, and Mr. and Mrs. Sprague left on the 4 o'clock train for Montreal, New York, and other eastern cities.

At the present time large shipments are received from Norway and Sweden via the Manchester Ship Canal, for local consumption and distribution to inland towns. In the matter of freight, Canadian shippers are at a disadvantage as to rates; but cannot this to some extent be overcome in the cost of production?

NEW BUCKEYE 1903 IMPROVED SAW MILL

Five sizes, Stationary and Portable. Has the essential points of a portable mill. Built on scientific principles. Quickly taken up and reset Easy running. Feed changed in an instant while going through the log, from ¾ inch to 5 inch. No feed belts to slip and wear out. Sold on its merits. Also Portable Engines. Write for particulars to

BRITISH COLUMBIA TIMBER ROYALTIES.

It is learned that the revenue accruing to the British Columbia Government from timber royalties, irrespective of that from timber licenses, during the months of July and August of the present year exceeds the revenue from royalties alone derived during any four months in the history of the province.

The revenue from royalties during the month of July, the first month of the present fiscal year, was in the neighborhood of $50,000, while that from the same source during the month of August is said to have been about $15,000, making a total of $65,000 in revenue for the two months.

INDESTRUCTIBILITY OF CEDAR.

The resistance of cedar wood to decay has long been famous, and cedar fence-posts often last for generations. A remarkable instance of the indestructibility of cedar has been noted in the State of Washington, where a forest of hemlocks, near Acme, has grown up over an ancient, buried forest of cedars. The trunks of cedar, although lying in a moist soil, have been almost perfectly preserved for at least one hundred and fifty years, the length of time that the rings of growth show the hemlocks to have been growing above their fallen predecessors.

THE DISTINGUISHING MARK

To install in your mill a set of saws that will suit you in every particular, it is necessary that you be familiar with some means of distinguishing the HIGH-CLASS SAWS from the others. Knowing some such mark you wil always discriminate in favor of the saw which bears that mark of QUALITY.

THE ATKINS "TRIPLE A" etched on all HIGH GRADE SILVER STEEL CIRCULAR and BAND SAWS, is the sign which assures QUALITY, EXCELLENCY and absolute SUPERIORITY in Saws. "IF IT'S SILVER STEEL IT'S AN ATKINS." Look for our trade mark.

A little reminder of the "TRIPLE A" in the way of a pretty watch charm to Mill men who write for it. Also our Mill Supply Catalogue. Both free.

CANADAIN TRADE WITH SOUTH AFRICA.

As the result of an arrangement entered into between the Canadian Government and the Elder, Dempster Steamship Company with regard to the new steamship service between Canada and South Africa, the company, with a view to developing the trade between the two colonies, have decided to make a new departure by placing at the di posal of Canadian merchants and manufacturers free of charge a number of passages as well as certain cargo accommodation for samples of Canadian goods and materials on their liners trading between Montreal and South African ports, and these goods and materials will be placed on exhibition at the Cape ports at which the steamers call. Each passenger representing a particular branch of Canadian trade will be allowed a section of from 10 to 20 tons capacity. The selection of exhibitors will be made by the President of the Board of Trade at Montreal and the secretary of the Canadian Manufacturers' Association of Toronto.

LUMBER—Fine established business in good Manitoba town, carrying a six thousand stock, making a fine profit; buildings complete, small amount of cash handles. THE LOCATORS, 55 Merchants' Bank Building, Winnipeg, Man.

CURRENT TRADE CONDITIONS.

ONTARIO.

The lumber trade has lost no ground during the past week, as there has been an average movement and prices have been well maintained. There are no signs of weakness, and it is believed that when the elections in this country and the United States are over there will be a revival in the demand for lumber and a stiffening of prices. While the quantity of unsold lumber at the mills will be larger than at the close of navigation last year, it will not be more than enough to supply the demand until the new cut is ready next year. Several of the largest firms will operate conservatively in the woods this winter and will figure upon stocking their mills for days runs only next season. In the face of a restricted production, there is no good reason for a decline in pine lumber prices.

The factory demand for hardwoods is more lively, which is taken to indicate that consumers have been running along with light stocks and are now willing to purchase for their winter requirements at present prices. Interior finish stock is experiencing a good movement, and there has been some improvement in the call for basswood.

QUEBEC AND NEW BRUNSWICK.

Increased activity is reported from some of the spruce districts, although the volume of trade is still small for this season of the year. There is a better feeling in respect to British business, the general opinion being that prices are likely to improve between now and the end of the year. Merchantable spruce deals are worth about $12 at St. John. Dullness prevails in logging circles on account of the contemplated contraction in operations. It is estimated that the coming winter's cut on the Upper St. John river will not be more than 65,000,000 feet, as compared with an average cut of about 120,000,000 feet. Operations on the Miramichi and Restigouche rivers will also be restricted, and in Nova Scotia a policy of curtailment will be followed to a lesser extent. There is an improved demand for lath, but shingles are still weak, with a larger number of sales of Extras at $3.10 for Boston delivery.

UNITED STATES.

Reports from the United States are not so universally favorable as last week, trade in the east in particular being somewhat dull. In Philadelphia and New York the volume of business is by no means satisfactory. In Chicago and district there is a vast amount of building under way and lumber dealers are doing a steady trade, with prices well maintained. The manufacturers in the Lake Superior district make no complaint as to business. The bulk of their output has been disposed of and the small balance is almost certain to be held at firm prices. Dealers are buying southern pine quite liberally and prices have advanced from $1 to $2 per thousand. There is less strength shown by spruce, random cargoes at Boston having sold at slightly lower prices. Hardwoods generally are in good demand. Much of the northern production has passed into the hands of dealers, who are endeavoring to keep up prices. It is predicted that there will be a liberal production of Wisconsin and Michigan hardwood logs the coming winter and

there is consequently some hesitancy on the part of eastern buyers. Plain white and red oak are in fair demand and light supply, soft elm is scarce and basswood is plentiful.

There has been a recovery of about ten cents in the price of red cedar shingles. Reports from Washington state that wholesalers are eager to buy and that the situation shows a distinct improvement. This has been reflected in other kinds of shingles, although no advance in the east has taken place.

GREAT BRITAIN.

Indications are more numerous that the British lumber market is gaining strength. Business in London is brisker and importers are beginning to speculate. If the market were removed from the influence of Baltic shipments, there would probably be a surprisingly quick recovery in prices, but as this is out of the question the improvement promises to be very gradual. Stocks are changing hands more freely between merchant and consumer than has been the case for many months, and prices at the recent public sales have maintained a fairly steady level. Spruce deals are showing unusual strength. One report states: "There has been a much better demand for spruce during the week, and if this were only to continue for a few weeks at the same rate, there would be a substantial rise in prices to record. Stocks of 3x9 unassorted spruce have been cleared by the principal agents at £9 per standard, and many lines of unassorted that sold at £8 5s at the auctions a short time ago have been resold by the buyers at £9 per standards." Importers are beginning to feel that there are not likely to be heavy consignments from Canada, which is doing much towards restoring confidence.

STOCKS AND PRICES.

E. B. Foss & Company, of Bay City, Mich., have imported from the Georgian Bay district about 5,000,000 feet of lumber a month during the season.

Crate & Sparham, of Smith's Falls, Ont., have just bought 400 acres in Beckwith Township, near Franktown, on which there is a considerable quantity of timber.

The Saginaw Lumber & Salt Company, of Sandwich, Ont., last week sold 3,000,000 feet of white pine lumber to the Detroit Lumber Company and Lowrie & Robinson.

The Spanish River Boom Company handled approximately 160,000,000 feet of logs this season. Last year the output was 200,000,000 feet and next year it is likely to be still smaller.

Robert Potts, of Fredericton, N.B., has entered into a contract with the St. John Lumber Company, of Van Buren, Maine, to cut 3,000,000 feet of logs for them during the coming season.

The Pigeon River Lumber Company, of Port Arthur, Ont., will have five camps in operation this winter, three on the Canadian side and two on the American side. It is expected that from 30,000,000 to 35,000,000 feet of logs will be cut.

Hon. E. J. Davis, Commissioner of Crown Lands for Ontario, is asking for tenders by November 15th for the right to cut the red and white pine timber on a number of small parcels of cut-over and burnt-over lands situated in the Townships of Burleigh and Johnson and district of Algoma. The berths in Algoma district include No. 108, on the north shore of Lake Huron, and Berth A, on Dog Lake, 64 miles west of Chapleau.

There is now about 18,250,000 feet of last season's log cut of the provincial operators hung up in the upper St. John river, divided as follows:

	Feet
Randolph & Baker	6,000,000
Cunliffe	1,000,000
Kilburn	1,000,000
Chouinard	1,000,000
Edgecombe & Eaton (McConnell's)	5,000,000
Doucett Landry	1,500,000
Scott Bros	1,500,000
R. A. Estey estate	1,000,000
Hallett	750,000
	18,750,000

In addition to this the St. John Lumber Company at Van Buren were held up for 7,500,000 feet. This company, however, will operate quite extensively this winter. They will get out about 15,000,000 feet. The Van Buren Lumber Company will also operate on a fairly large scale, their estimate being about 10,000,000 feet.

NEW BRUNSWICK LETTER.

(Correspondence of the CANADA LUMBERMAN.)

ST. JOHN, N. B., Sept. 30th, 1904.—Things are somewhat brisker in lumber circles than they have been for some months past. All the mills in this vicinity are running at their full capacity and the annual output of this year promises to be about the average. Logs are coming along very freely and the indications are that there will be perhaps 20,000,000 feet piled and wintered at this port alone. As far as is known at present there have been very few large contracts made with loggers. This is a sure indication of a small cut this winter, as under ordinary conditions the choppers are in the woods by this time.

Many manufacturers are in a position this year where they have to run their mills at a loss or cease sawing altogether, owing to the high price they paid for their logs. As it means a heavy sum of money being tied up for a year at least unless they did so, those who were in that position have preferred to do the former. It may be depended upon that they will not be in a similar condition next year. This means that they will be more cautious in buying and contracting and already the reaction is being felt in logging circles, which fact is indicated in a lack of demand for woodsmen and a consequent falling off in wages in that line ranging from 10 to 15 per cent.

While shingles have not shown any increased activity during the last fortnight, laths appear to be considerably more in demand and those who have any to sell are very hopeful of what the next month will bring forth. Shipments of laths have been fairly heavy since last writing, but the quantity of shingles on the different wharves has increased perceptibly.

The English market looks somewhat brighter than was the case at this time last month. Enquiries are more frequent and the demand has increased to such an extent that those interested are just now feeling very optimistic. Of course, this demand is not by any means heavy, but, compared with the depression of the last few months, it is decidedly encouraging to the manufacturers.

Shipments have been sufficiently heavy to make considerable wharf-room and charters are booked that will relieve any inconvenience from this source for the next two months even if no further sales were made.

Prices have rallied and the indications seem to be, according to the opinions of men who are in a position to judge, that they will be higher yet before the closing in of winter.

Some large lots have been disposed of at prices ranging from $11.75 to $12.00 per M's. ft. for Merchantable (usual percentages of widths) 2/3 price for Fourths and Ends, f.o.b. steamer at New Brunswick port.

Charters to the West Coast of England are plentiful at 35s. per standard.

TO HOLDERS OF BIRCH LIMITS.

Can you cut birch into Squares, etc. We can also take birch cut on the sweep with a jigger or small band saw. Large quantities required. Write in first instance to "Finance," care CANADA LUMBERMAN.

BRITISH COLUMBIA LETTER.

(Correspondence of the CANADA LUMBERMAN.)

VANCOUVER, B.C., September 26, 1904. —The depression in the lumber business has been the cause of a cut in prices of lumber in this city, and the war has been carried on by the millmen until now figures are in many instances as much as 35 per cent. off the list price. It all started in one firm giving a price below the schedule agreed upon by the B C. Lumber and Shingle Manufacturers' Association, and to which all the members subscribed, and of another when hearing it going it still lower. Shingles are being sold for $1.35 and $1.50. "There are times," one of the prominent manufacturers said on Saturday, "when most of us feel we should be put in an asylum until this irrational feeling has worn off. We know we are hurting ourselves and the trade, but still we go ahead."

A feature of the depression in the logging industry is the cornering of the available supply. Especially is this the case in cedar. Most of the independent loggers are in financial difficulties, and since the government has refused to allow export, they have to wait until conditions brighten. They have stopped cutting, and those who have the money are now quietly buying up all the cedar and the fir. By spring logs may take a big jump and will be very high if the winter is as unfavorable as last in getting out timber.

Export of lumber is small. The fleet now loading is only three vessels, the fewest on record. They are the Harold and Halewood at Hastings mill, and the Olivebank at Chemainus. Three charters only are reported, the William H. Talbot, the Admiral Tegethoff and the Balboa. A record was made in loading the Olivebank. She took on 2,5[illegible]7,000 feet, the largest cargo ever shipped at Chemainus, and this was put on through one hatch by the Victoria & Vancouver Stevedoring Company in 22 lay-days, an average of 114,000 feet per day.

Several mill fires have taken place during the month. The mill at Kamloops of the Kamloops Lumber Company, of which George McCormick, M.P., is president, was burned, with a loss of $20,000. Some lumber was also burned. Mr. G. F. Fowler, M.P., is on his way west, and when he arrives it will be decided whether the mill will be rebuilt at Kamloops or Savano. Messrs. Braden & Johnston, who have a mill at Salmon Arm, lost the plant and all their lumber. The loss will be about $2,500, with no insurance. Mr. McCormick, when he heard of the misfortune, kindly offered to supply them with a boiler. They will rebuild so as to be ready to cut early in the spring. A watchman slept at the No. 1 mill of the King Lumber Company, near Cranbrook, and the mill was burned, he escaping with difficulty from the burning building. No lumber or logs were burned. Loss $25,000, with some insurance. The Capilano Lumber Company, operating about seven miles from the mouth of the Capilano river, from which Vancouver gets its water supply, has suffered the loss of its saw mill.

Mr. J. Taylor, principal owner of the Arrowhead Lumber Company, has gone

east after the disposal of the company's interests to McMillan Brothers, the Great Northern contractors. The price paid for the property was between $275,000 and $300,000.

It is understood that the Canadian Timber and Sawmills Co., Limited, the mill of which was seized at Trout Lake, will be reorganized, and that it will be operating shortly. The investment there is a large one.

Timber Inspector John Murray returned last evening after making one of the largest seizures in the history of the province, and, in fact, of Canada. Americans were cutting timber on provincial lands in the southern portion of the Fraser delta and shipping it to the other side, contrary to the law forbidding export, except under heavy tax. He found several large camps in full operation, and it is estimated that they must already have shipped several millions of feet of fine timber. A number of booms of logs were ready for shipment

New Orleans, La.

and were seized. In all, the value of the camps and timber will amount easily to $100,000. The logs were being purchased by the Monarch Lumber Company and the Erie Lumber Company, of Blaine. The steal is one of the most audacious in the history of the west, it being only about 20 miles from New Westminster, and had been going on for six or eight months. Large donkey engines were being used, and the owner of one of the camps stated that had the seizure been made a day or two later, he would have been out $6,000 more, as relying upon the success of operations to date, he had completed a deal to buy private timber, and was to have paid $6,000 cash to-day.

The schooner William Marshall, from St. John, N.B., lost her deck load of laths at New London, Conn.

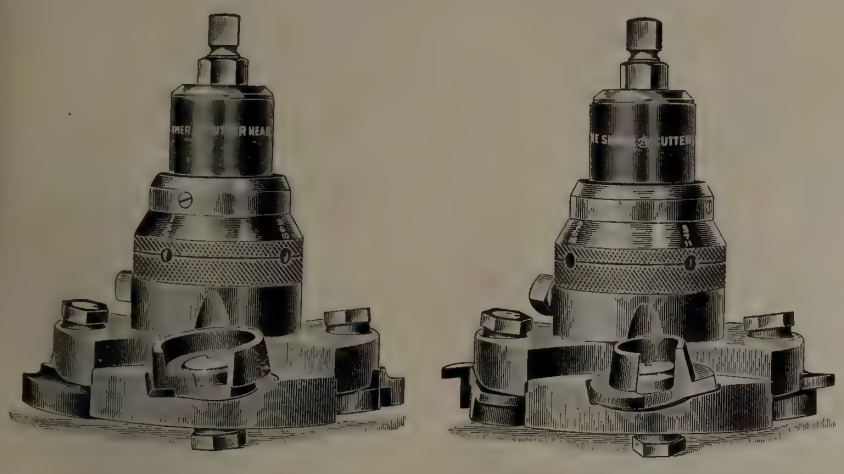
The Shimer Cutter Heads

WITH EXPANSION

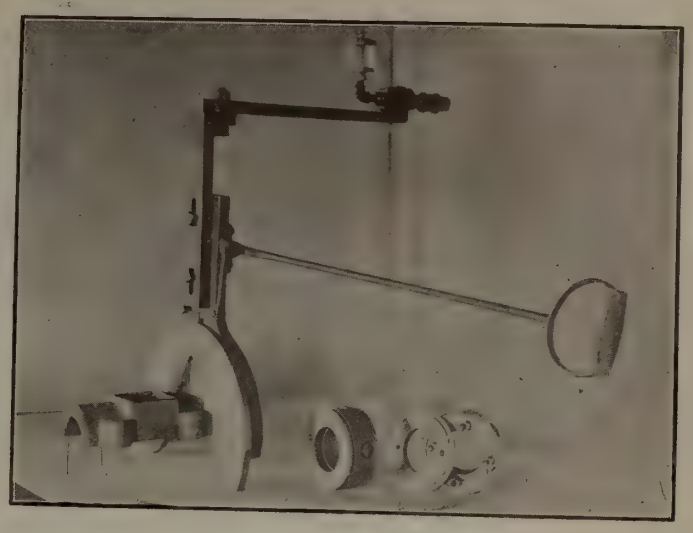


Are built from forgings of Steel and finished throughout in the solid metal. This insures accuracy, durability and perfect mechanical adjustments.

They are appreciated by the user because they hold up under the severest tests. They cut easily all kinds of hard, knotty and cross-grained lumber. If you make single tongue and groove Flooring, Ceiling and Wainscoting, buy THE SHIMER CUTTER HEADS and you will have no disappointment. Address

SAMUEL J. SHIMER & SONS

Milton, Pennsylvania



"KILLAM'S TANDEM CIRCULAR SAW MILL"

The attention of Manufacturers of Lumber is called to the above named latest and best method of sawing lumber.

The following advantages are obtained:

Lower cost of installation than any other method which will saw an equal number of superficial feet in a given length of time.

Smaller expense in operation, thus producing lumber at a lower cost per thousand feet than any other method.

Requires no more help to operate it than any well equipped Circular Saw Mill.

Lumber has been sawn better and more accurately cut by this method than by any other now in use.

The Killam Tandem Circular Mill requires no more skilled men to operate it than is required to operate the ordinary Circular Mill.

If solid saws are used, the larger one, when worn down can be used for the smaller one thus saving expense for saws.

No difficulties in handling or setting by this machine and no delays.

No time is lost in setting for any thickness from the cut of stationary saw up to six inches.

This machine takes the place of a resaw in a mill and only requires a floor space of 6 ft. x 6 ft.

Also takes the place of a Twin Circular Mill that is now used for slabbing, and this machine will side as much lumber as any Twin Circular, thus saving the expense of a resaw and men to operate the same.

This machine is so cheap that any manufacturer of lumber can well afford to have one, for it will pay for itself in a short time.

Will cut 50 per cent. more lumber than the Circular Mills now in use.

MANUFACTURED BY OXFORD FOUNDRY & MACHINE COMPANY, OXFORD, N. S.

REFERENCE.

M. L. KILLAM, TRURO, N. S.

Dear Sir,—It gives us great pleasure to testify to the value of your Tandem Circular Saw Mill. It has paid for itself twice over during the six months we have run it. It requires no more help to operate it and the lumber is more evenly sawn. It does all that you claim it will and we would recommend it to any manufacturer who wishes to make more and better lumber with the same help as with the Single Circular Mill. Wishing you success, we are Yours very truly,

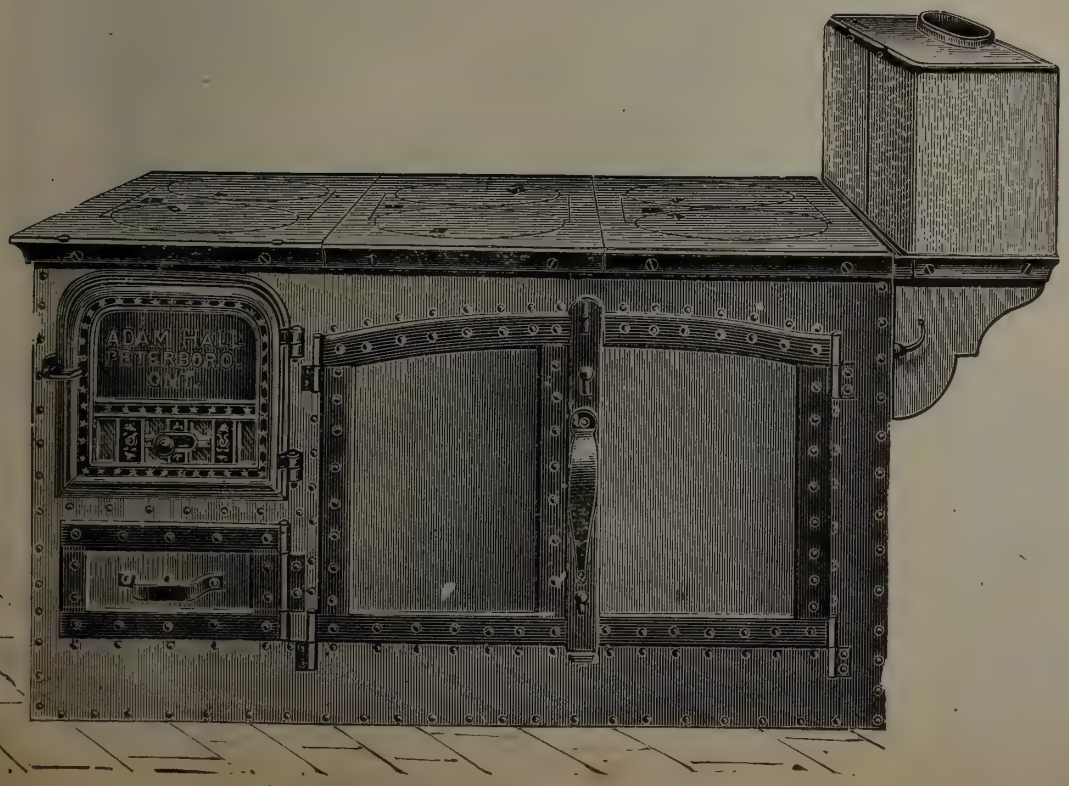
Dec. 31, 1903. DICKIE & McGRATH, Tusket, N. S.

ADAM HALL, PETERBOROUGH, ONTARIO CANADA

. . . MANUFACTURER OF . . .

STEEL RANGES

For Lumbermen's and Railway Camps, Boarding Houses and Hotels



Lumbermen's Six Pot Hole Range with Reservoir.

The Lumberman Heater

36 Inch Lumberman Heater
42 Inch Lumberman Heater
48 Inch Lumberman Heater

This Heater is used in heating Lumbermen's Camps, Boarding Houses, School Houses and large buildings.

The body of the Heater is made of Heavy Boiler Plate. The ends are made of Heavy Cast Metal, with a large Fire Door.

It is a perfect Heater, and very durable.

We have been manufacturing Steel Ranges and Heaters for Lumber Camps for the past Twenty-four Years, and have supplied the wants of nearly all the Lumbermen in Quebec, Ontario and Manitoba—they are unexcelled for Baking and Cooking, and are strong and durable.

This No. 10-25 Range with 25 Gallon Copper Reservoir is the one we sell the most of, owing to the convenience of having a supply of hot water at all times. Will cook for 50 to 60 men. Weighs 450 pounds.

THE BRADSTREET COMPANY gathers infor mation that reflects the financial condition and the con trolling circumstances of every seeker of mercantile credit. Its business may be defined as of the merchants, by the merchants, for the merchants. In procuring, verifying and promulgating information, no effort is spared, and no reasonable expense considered too great, that the results may justify its claim as an authority on all matters affecting commercial affairs and mercantile credit. Its offices and connections have been steadily extended, and it furnishes information concerning mercantile persons throughout the civilized world.
Subscriptions are based on the service furnished, and are available only by reputable wholesale, jobbing and manufacturing concerns, and by responsible and worthy financial, judiciary and business corporations. Specific terms may be obtained by addressing the company or any of its offices. Correspondence invited.

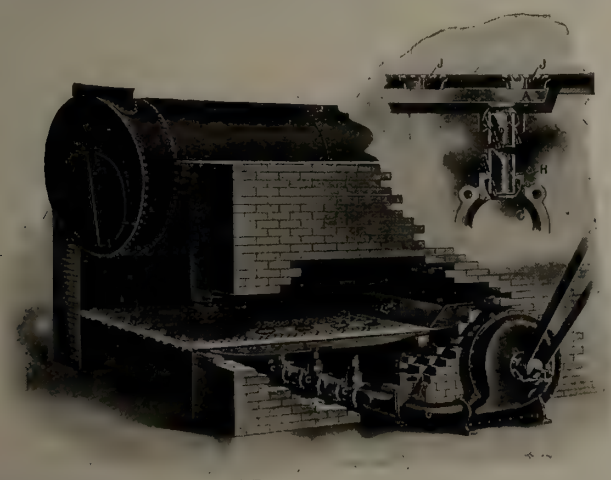
A MILLION POUNDS OF GRATES.
The value of the Gordon Hollow Blast Grate in promoting combustion is strikingly illustrated by the fact that our annual sales of grates and connections approximate one million pounds.
This celebrated grate certainly affords the best and most economical means in existence for disposing of sawdust and other refuse. It will burn them in your furnaces or ovens, even though wet, green or frozen, producing as good results with such fuel as an ordinary grate gives with dry wood.



Shutting down to wait for steam to rise is expensive and demoralizing. Your output ceases and your expenses continue. The Gordon Hollow Blast Grate makes it unnecessary, as it adds from 20 to 50 per cent. to the steaming capacity of a boiler, and gives the fireman perfect control over his fire, regardless of atmospheric conditions.
By reason of the substantial construction of the grate, and of the fact that the blast bars are filled with a current of fresh air, the durability of the Gordon Hollow Blast Grate is such as to make it in the end by far the cheapest grate of any description, draft or blast, to be obtained.
We do not ask you to take our word for the foregoing, but are perfectly willing to ship you an outfit with the written understanding that you may test it for thirty days in any manner in which you may see fit, and that, if you conclude it is not for your interest and advantage to retain it, you may remove it at any time before the expiration of such thirty days, and return it at our expense. This is certainly the broadest guaranty it would be possible to give. It absolutely protects you, and strikingly demonstrates our own unlimited faith in the grate, based on sixteen years' experience.
WE ALSO MANUFACTURE:
The TOWER 2 and 3-saw Edgers, Improved. For mills cutting not to exceed 20,000 ft. in ten hours.
The TOWER EXTRA 3-saw Edger. For mills cutting up to 30,000 ft.
The TOWER One-man 2-saw Trimmer. With this trimmer one man can easily trim the output of a mill cutting up to 30,000 ft. in ten hours.
The Gordon Hollow Blast Grate Co., Greenville, Mich.
ESTABLISHED 1889.
The largest manufacturer of Blast Grates, Edgers and Trimmers in the world.

MADE IN CANADA
FAIRBANKS WOOD-SPLIT PULLEY
The Best for Saw and Planing Mills
This pulley is not an experiment but has been sold for several years past all over the United States, and the universal satisfaction it gave and the success it met with prompted us to manufacture in Canada.
It has a reputation superior to that of any other Pulley for merit of design, workmanship and finish.
The web construction (see cut), built in the rim, not only strengthens the entire Pulley but makes it impossible for the rim to work loose at the arm.
Each segment is not only glued but nailed with three nails to the next one. Four point bushings are used, giving twice as much grip on the shaft as in the usual two piece bushing.
The merits of any article are best proved by a trial. Send us a trial order the next time you want any pulleys. We carry a large stock and with our factory in Montreal can supply any special pulley in 24 hours if not in stock.
The Fairbanks Co.

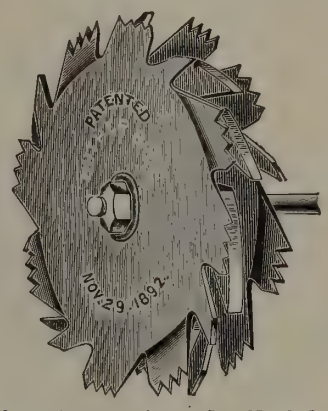
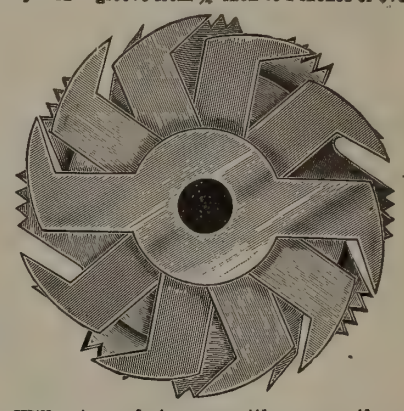
HUTHER BROS. PATENT GROOVER OR DADO HEAD

For cutting any width groove from ¼-inch to 2 inches or over



Can be used on any Circular Saw Mandrel.



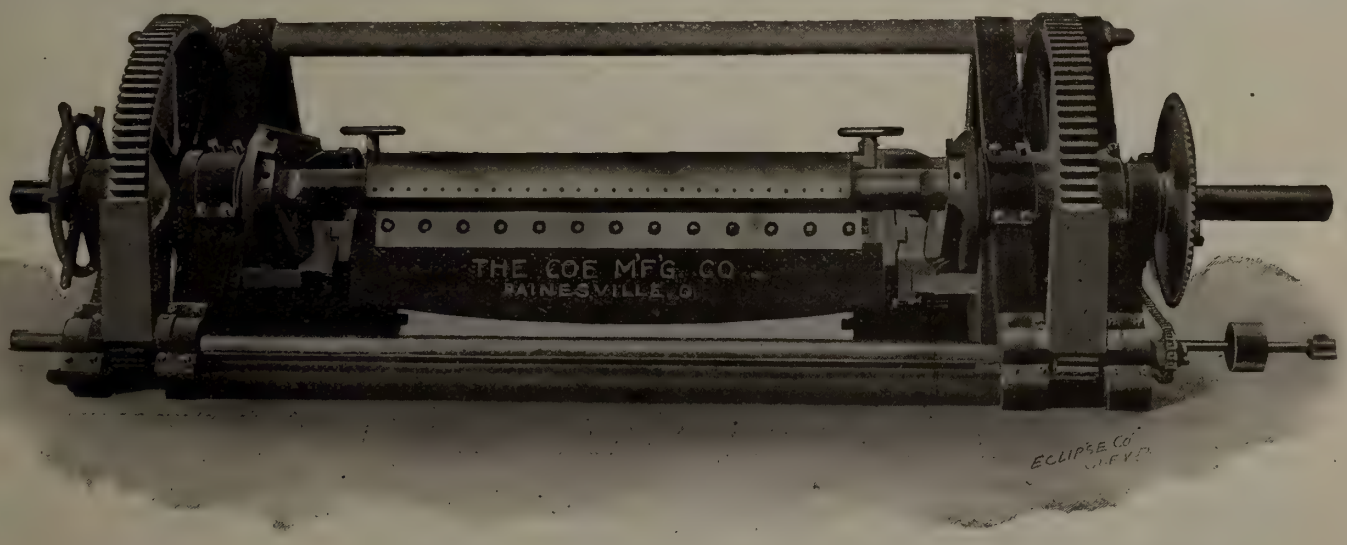
Will cut a perfect groove with or across the grain.

This is the only Dado Head on the market that gives entire satisfaction on all classes of work. No screw adjustment. For different width grooves, simply remove or add inside cutters. Sold by builders and dealers of woodworking machinery in all parts of the United States. Will send on approval, in competition with any other make on the market; if not the best return at our expense. HUTHER BROS., Platt Street, ROCHESTER, N.Y., manufacturers of Circular Saws, Morgan Pattern Lock-Corner Box Cutters, Concave Saws, etc.

Our Celebrated

Rotary Cutting Veneer Machines

made in over sixty sizes, have stood the test and proved equal to any proposition to reduce logs into thin lumber and veneers.



The product is high grade.
The output is great.
The cost of operating and maintenance is reduced to a minimum.
Quite a combination, is it not?

Timber and mill owners should get in early.
Buy a Coe Veneer Cutting and Drying outfit and prepare to supply thin lumber and veneers which have a healthy growing demand. More money in it than sawing your logs into lumber.

Reliable Veterinary Remedies

No logging outfit is complete without a supply of reliable veterinary remedies. Getting the wrong kind means the loss of the use of your horses when time is valuable.

Johnson's Veterinary Remedies are guaranteed never to fail when used as directed. You get your money back if they ever do.

They are

Johnson's Horse Linimint No. 1.
A penetrating Alcoholic Linimint. Put up in one gallon jugs, with full directions, per imperial gal. **$4.50**

Johnson's Horse Linimint No. 2.
A combination of the best oils used as linimints, imp. gallon . . **$3.00**

Johnson's Horse Colic Remedy.
A sure and speedy cure for colic Imperial gallon **$5.00**

Johnson's Veterinary Healing Ointment.
Positively the best all-round healing ointment made. In use by the largest owners of horse flesh in Canada. Put up in 2 lb tins, each . . **$2.00** or in ¼ lb tins, per dozen . . **$3.00**

Johnson's Condition Powders. (Concentrated).
Put up in bulk, per lb . . . . **3c.**

These goods being put up in bulk are more economical than others, as cost of bottling, etc., is saved.

CAMP REMEDIES.

In addition to our Veterinary Remedies we make a line of medicines for lumbermen, including a strong, penetrating linimint, healing ointment, cholera cure, liver pills, cough syrup, in fact anything in the form of Camp Drug Supplies. We know that there are no better remedies made than those we offer. There may be others nearly as good, but they lack our guarantee. Satisfaction or money back. A trade discount of 10% allowed off all orders amounting to $100.

Graduated Steel Post Foundation

Eliminates the trouble and expense of providing an inclined base for the track supports.

The footing of all the posts in the new foundation of

The Standard Dry Kiln

Is on a level. The incline is secured by the graduated height of the steel posts, as shown in the above cut. We furnish posts of any desired range in height.

This style of foundation can be applied to old kilns as well as to new. Estimates will be furnished promptly on request. Write for full particulars. Ask for Catalogue "D."

"The Standard" Graduated Steel Post Foundation has been patented by us—patent number 768,458, granted Aug. 23, 1904.

THE STANDARD DRY KILN CO.
Indianapolis, Indiana, U. S. A.

THE TRIUMPH TURBINE

Is the most powerful wheel on the market to-day. A glance at this cut of the centre shows that the buckets are designed to secure the **maximum** of **speed** with **great power** and a **free discharge.** Mr. E. S. Edmondson, of Oshawa, writes as follows under date of November 16th, 1903, regarding a 26 inch Vertical Triumph Wheel:

> "The Wheel is strictly first-class in every particular, and after a careful and thorough test I am prepared to say that I believe it is the best wheel in the market for Electrical purposes. It has high speed, large power, high efficiency at part gate, and has practically no leakage. I am more than pleased with the thorough and workmanlike setting you gave me throughout."

For horizontal settings in large Pulp Mills, Cement Mills or Electric Power Developments this Wheel has no equal. We invite your enquiries. Large catalogue to be had for the asking.

We are always glad to submit estimates and prices on **Improved Vulcan and Leffel Turbines, Improved Lane Circular Saw Mills, Edgers, Trimmers, Slashers, Shingle Machines, Lath Machines** and all machinery of this kind.

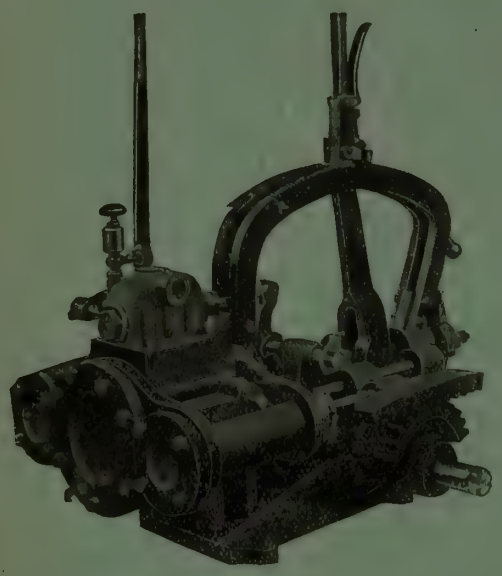
SAW MILL MACHINERY



Saw mill men are fast finding out and appreciating the great saving effected by using Steam Setting Machines.

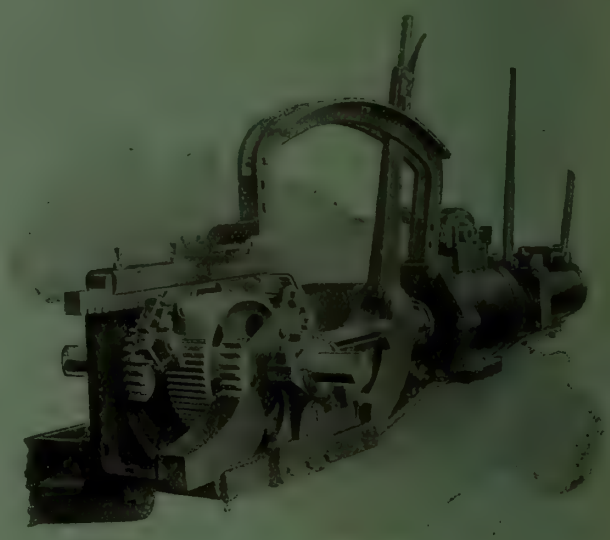
We have supplied these machines on trial on the understanding that they were to be returned to us if they did not give every result promised.

Not one of them has ever been returned.

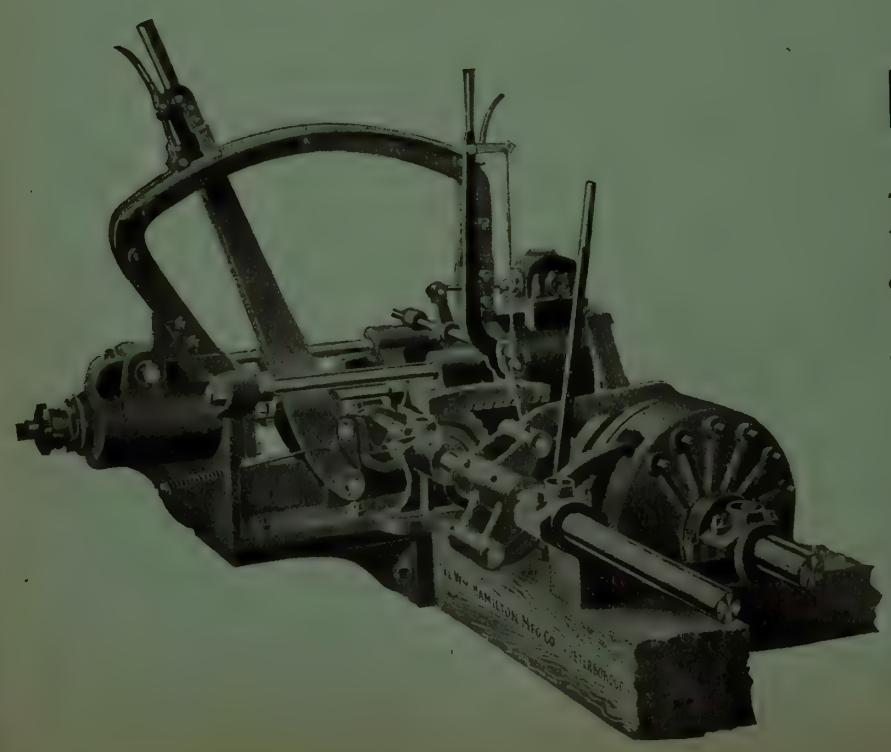
Ask your setter if he could not do better work with one of these machines, then write us for prices and catalogues.

The standard size machine, as shown in cut, is well known to all mill men. Every one in operation is proving daily that you can cut more and better lumber with it.

When deciding on your improvements for next season you must take this machine into consideration.



This cut shows our Steam Set Works for the large blocks in use on the Pacific Coast. It is a very powerful machine, and will set for two-inch lumber as quickly and more easily than the hand lever now sets for one.



Our last illustration shows our

IMPROVED STEAM SETTER

WITH ENCLOSED RATCHET SET WORKS

This is an improved form of the standard machine. We consider it is the most reliable and efficient form of Steam Set Works that exists at the present time.

It will set four inches with one throw of the lever, and is just the thing for mill men saving timber for export.

We are anxious to tell you more about any of these machines. Why not send for our catalogue?

CURRENT TRADE CONDITIONS.

ONTARIO.

So long as the weather continues favorable for outdoor work there will be activity in lumber circles. Building operations are being carried on with exceptional rapidity, and the stocks of retail dealers have become somewhat broken. Many of the latter deferred the buying of lumber too long and now find that the concessions which they were offered in the summer months have been cancelled. It may not be a rising market, but it is evident that stocks are more firmly held than at the beginning of October. Importations of American lumber into Western Ontario are increasing and are serving to check any advance which manufacturers might consider was warranted by other conditions. There is not much buying either of pine or hardwoods for speculation, as the disposition seems to be to watch the trade development after the Presidential election in the United States and act accordingly. It is predicted in some quarters that pine lath is destined for higher prices. There has been liberal buying of that commodity, as also of shingles, which are exhibiting a stronger tone.

QUEBEC AND NEW BRUNSWICK.

Those who anticipated an improvement in the demand for spruce lumber in the Fall have not been disappointed. The market is stronger than at any time for months, and it is not improbable that prices will be higher at the end of the year than now. The manufacturers are handling the situation in a masterly way; very little stock is being thrown upon the market at a sacrifice and operations in the woods are being arranged for on a reduced scale. These factors are favorably influencing the market. Clapboards are one of the dullest lines among the American exports. Shingles are unchanged at $3.15 for Boston delivery, while lath are if anything a little firmer.

UNITED STATES.

Activity in lumber has subsided during the week, and the cause may be found in the approach of the election. More attention is being given to political matters than to business. The strength of the market, however, has not been impaired, but on the other hand white and yellow pine are even stronger than last week. Stocks of the latter are broken and the supply is scarcely equal to the demand. There is a larger stock, comparatively, of white pine lumber, but it is mostly in the hands of wholesalers. Dealers and consumers have been pursuing a hand-to-mouth policy and are therefore not well equipped for the winter trade. After the Presidental election there will doubtless be liberal buying for stocking up purposes. Barn grades are very scarce at Buffalo and Tonawanda, with not much hope of materially increasing the supply before the close of navigation. There is a fairly good movement of common pine. Cargo spruce is said to be a little easier, with 2x3, 2x4 and 2x6 offered somewhat liberally. Clapboards are very quiet.

It is now admitted that the input of hardwood logs during the coming winter is likely to be large, but it has as yet had no effect upon lumber prices. Basswood is selling more freely than earlier in the season and birch and soft elm are experiencing a lively demand. There is practically no change in prices.

GREAT BRITAIN.

The British lumber market is still irregular, and as the importing season is nearing an end, it is a foregone conclusion that dullness will continue until the close of the year. In London, Hull, and East Coast ports there has been a slight improvement, but in the west of England generally conditions are no better than one week ago. There have been heavy losses in the building trade at Bristol, which has accentuated the depression. Business during the past week has also been disturbed by the North Sea incident, and at time of writing the situation between England and Russia is regarded as somewhat critical. The disposition on all sides is to pursue a very conservative policy in respect to lumber buying. Some of the dealers, however, who have been running along on very light stocks for some time, now find it

necessary to increase their supplies so as to be in a position to meet the wants of their customers during the winter months, and this has made a show of activity. Canadian pine and spruce deals are firm and the business is considered to be on a satisfactory basis. Some reports state that there has been a further advance in spruce, and that several sales have taken place on the basis of £6 10s. per standard c.i.f.

STOCKS AND PRICES.

Loveland & Stone, of Cutler, Ont., will put in about 60 per cent. of their last winter's stock of logs. At Byng Inlet, Holland & Graves have camps in operation and are figuring on putting in at least 35,000,000 feet this winter.

P. G. Keyes, Secretary of the Department of the Interior, Ottawa, will receive tenders up to Wednesday, November 30th, for a permit to cut timber on Berth No. 1187, in the Province of Manitoba, containing an area of 6¼ square miles.

The Saginaw Lumber & Salt Company, of Sandwich, Ont., recently sold 2,000,000 feet of pine lumber at within 50 cents a thousand of what was offered last spring. This company will carry over 6,000,000 feet of logs and put in about 15,000,000 feet.

THE OTTAWA VALLEY.

(Correspondence of the CANADA LUMBERMAN.)

OTTAWA, October 26, 1904.—Activity is reported from all sides in the lumber business of the Ottawa Valley. The railway people report an increased movement of lumber to New York and other points in the Eastern States. The movement of lumber for export to England also shows an improvement, but it is not so marked as in the case of the American trade. The early approach of the close of navigation on the Hudson canals is one of the reasons for the fall rush of lumber. American dealers have considerable stock standing in the Ottawa district yards, and they are desirous of getting this out before the close of navigation advances the transportation rates.

It is the general impression that the American market is in better shape for business, but local dealers do not hope for much beyond a general sorting up for the Fall.

Reference to the market page will show several changes in the quotations from the Ottawa district, good sidings, strips and shorts all being easier in price.

From the limits come reports of activity in the log and square timber manufacture. Labor is easier to obtain than last year, and the men are working with a better will, and it is believed will stick closer to their jobs than in previous seasons, when, strange to say, high wages made them discontented. It is generally thought that there will be a reduction of fully a third in the log cut and two-thirds in the cut of square and waney timber. Wet weather has interfered to some extent with operations.

From all reports spruce is firmer than it has been for several seasons back.

TO HOLDERS OF BIRCH LIMITS.

Can you cut birch into Squares, etc. We can also take birch cut on the sweep with a jigger or small band saw. Large quantities required. Write in first instance to "Finance," care CANADA LUMBERMAN.

NEW BRUNSWICK LETTER.

(Correspondence of the CANADA LUMBERMAN.)

ST. JOHN, N.B., October 31st, 1904.—The lumber trade has shown no marked change since last writing, and it is unlikely that there will be any during the remaining months of 1904 that will affect the local manufacturers so far as the cut for November and December is concerned. The 10th of December will probably see all save two or three of the mills in St. John and on the St. John River closed down for the season, to resume operations on or about the 1st of March.

Several important logging contracts have been made during the last fortnight. Compared with those of last year a reduction in the price of from 50 cents to $1 per M is the rule. The quantity will not equal that of last year's operations by at least 25 per cent., and the difference will probably be as great as 35 per cent. The wages being paid to woodsmen is from $2 to $4 per man lower than was the case last winter. Owing to the reduction in demand, men are quite plentiful. Horse-flesh is scarce and dear, good horses ranging from $190 to $225 each in price.

This winter, like last, the contracts for American logs are very small compared with what was the rule for many years prior to 1903, several American manufacturers have contracted for Provincial logs only.

Shipments of short lumber have been lighter during the latter half of the month than was the case during the first half. Stocks of cedar shingles are fairly heavy in the high grades; six to six and one-half millions would probably cover the amount. Orders are booked for immediate delivery that will dispose of at least one-third and very probably one-half of these. Within the last fortnight the shingle trade has shown a considerable stimulus in the New England States. This stimulus has not as yet resulted in any advance in price, which has been uniform and practically stationery during the last two months.

The manifestations of an improvement in the English market, as mentioned a fortnight ago, continue, and the general impression is that the first of the year will find prices and demand equal in every way to the conditions which existed before the slump which took place early in 1904.

The shipments of English deals have been rather light during the last month.

WANTED: Basswood, Birch, Hard Maple, Red and Soft Elm Lumber
Office and Yard—571 Dorchester Street, MONTREAL, P.Q.
Telephone Main 368. Correspondence Solicited

Stocks are slowly multiplying, but it is an assured fact that sufficient will go forward during November to cover at least what will be manufactured between now and the time for closing down. In that case, taking into consideration the sales which are certain to be made during the winter months to go forward by the winter port steamers, the 1st of March will in all probability find the localwharvesentirely cleaned up so far as English deals are concerned.

The improvement in conditions in the English market has taken place so late in the year that it will probably have little effect on manufacturers' prices or on the volume of shipments during the balance of 1904, but it is confidently expected that when the time comes to resume operations, conditions will be much more favorable.

BRITISH COLUMBIA LETTER.

(Correspondence of the CANADA LUMBERMAN.)

VANCOUVER, B.C., October 24th, 1904. —It does not require any person particularly gifted with the powers of observation to see that the lumber industry of British Columbia, from the eastern boundary of the Kootenay to the Pacific Coast, is in a very depressed condition, yet Mr. Robert Kerr, passenger traffic manager of the Canadian Pacific Railway, who has just returned to the east after a trip to the west, has declared that it is flourishing. In Winnipeg, Montreal and other papers have appeared interviews with him, and all state that the lumber industry was never better. British Columbia lumbermen do not know what particular reason Mr. Kerr may have for thus misrepresenting conditions, for if he kept his eyes shut altogether while in the west he would have heard sufficient to make him aware that the lumber industry is in bad shape. In fact, some disasters may result. If so, he will no doubt affect considerable surprise. The industry could very easily be put in a flourishing condition, for at the present time about 12,000,000 feet of lumber per month comes in from Washington state. The argument has been advanced that if a duty were put on the price of lumber would be increased, but, if so, the government has the remedy in its own hands, and may repeal the duty. On the other hand, the millmen claim the price will be reduced, for with a greater volume of business lesser profits would be satisfactory.

Fernie is to have another large mill, which will be erected by those already interested in the Elk Lumber and Manufacturing Company, which has one large mill there now. O. A. Robertson, of St. Paul, F. B. Lynch and O. L. Boynter, of the same city, and G. F. Ditbinner, of Minneapolis, are at Fernie this week looking after the commencement of the construction. They state the machinery will be the finest obtainable, and the capacity will be 100,000 feet in ten hours, with a cost of at least $75,000. These people are reported to have exceedingly large capital behind them, and the enterprises in which they have engaged in the west lead to the belief that this is correct. Besides the Elk Lumber and Manufacturing Company, which is a large concern, they have established a very modern mill on Red Deer Lake, in the Saskatchewan district, establishing the town of Barrows.

Local conditions are unchanged. Lumber is still cheaper than usual, remaining almost at the figure to which it was brought by the rate war, and it is expected that it will be low all winter. Many who had building operations in prospect are taking advantage of the opportunity, which means considerable in the construction of a dwelling.

Lumbermen and mill owners at Edmonton and Strathcona have arranged a new scale of prices which is much below that which has hitherto prevailed.

The Canadian Timber & Sawmills, Limited, whose property at Trout Lake has been in possession of the sheriff, has been reorganized, with three directors in Revelstoke and two in London. W. Cowan, of Revelstoke, who is heavily interested, having taken shares in payment for timber, is the new manager.

G. B. Campbell, of Glencoe, Ont., J. McGregor, Enderby, B.C., P. D. McKellar and H. Healey, of Bellingham, Wash., are cruising about the headwaters of the Tulameen river, in the Similkameen district, looking for timber suitable for ties.

TIMBER SALE.

The State of Minnesota had a timber sale in St. Paul October 21. The sale was successful as far as it went, but only 28 tracts out of 114 offered for sale were taken. On the other tracts the lumbermen declared that the appraised price was too high and declined to bid. The timber sold was nearly all good pine. In all about 40,000,000 feet were sold, at prices ranging from $3.50 to $9 per thousand, but for the most part ranging from $7 to $8.50.

The Cloquet Lumber Company was the heaviest bnyer and took 8,500,000 feet in one block at a bid of $8.50 a thousand. The highest price paid, $9 a thousand, was by the Shevlin-Carpenter Lumber Company, of Minneapolis, who are also operating in the Lake-of-the-Woods district in Ontario.

This Saw Stands Without a Rival

AND IS THE

FASTEST CUTTING SAW IN THE WORLD!

Its Superiority consists in its Excellent Temper. It is made of "Razor Steel," which is the finest ever used in the manufacture of Saws. We have the sole control of this steel. It is tempered by our secret process, which process gives a keener cutting edge and a toughness to the steel which no other process can approach.

Maple Leaf Saw Set

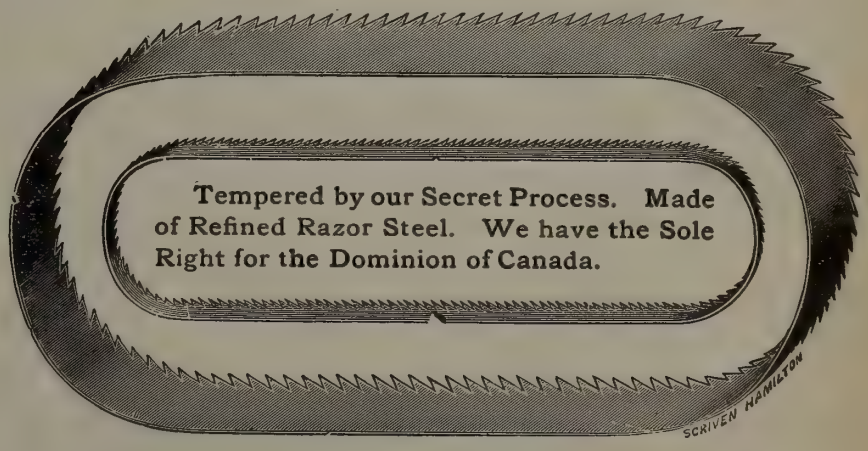
MANUFACTURED BY

SHURLY & DIETRICH, Galt, Ont.

Directions.—Place the set on the point of tooth, as shown in the accompanying cut, and strike a very light blow with a tack hammer. If you require more set, file the tooth with more bevel.

I you follow directions you cannot make a mistake. Be sure and not strike too hard a blow, and it will set the hardest saw. **On receipt of 40 cents we will send one by mail.**

We are the only manufacturers in the world who export Saws in large quantities to the United States.



We Manufacture

HIGH GRADE BAND SAWS

Of All Widths and Lengths.

These Saws are made of Refined Swedish Steel imported direct, and tempered by our Secret Process; for Fine Finish and Temper are not excelled.

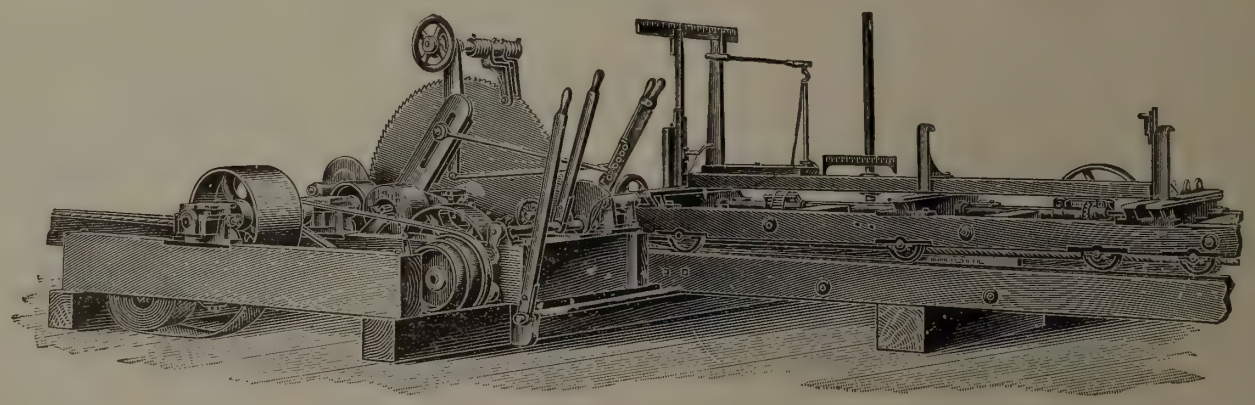
Stationary and Portable Saw Mills



I make these mills with any number of Head-blocks spaced any distance apart. Equipped with Frost-dog, Knight dog, or Boss dog, Rope feed, or Rack and Pinion feed. With or without Over Log Saw Guide.

Having extra wide face friction pulleys, they are more durable and quicker acting than any others and make a first class tie mill. One of my customers reports 1,600 R.R. ties per day with our saw.

I furnish them with or without Track Sill frames or in any desired way.

THE LUMBERMEN'S CLUB OF OTTAWA.

The officials of the Ottawa Valley and Georgian Bay lumber firms have formed an Association in Ottawa, to be called "The Lumbermen's Club." The object is a purely social one to foster a feeling of good fellowship and to afford all members an opportunity of meeting and discussing subjects common to all.

A large club room has been secured and furnished with magazines, newspapers, pool and billiard tables, etc.

The annual meeting will be held during the month of July each year, for the election of officers and transaction of business, when the initiation of candidates will be a prominent feature.

The Club is not exclusive and admits as honorary members business men having transactions directly with the lumber trade. All members are supplied with such names and are recommended to patronize the honorary members as far as possible.

The officers' position in the club corresponds to the same position held by them with their respective firms, as follows:

W. N. Vaughan, Agent, (Fraser & Co.)

Wm. Burns, Bookkeeper, (Fraser & Co.)

Thos. Reynolds, Foreman, (McLachlin Bros.)

Harry W. Link, Culler, (Hawkesbury Lumber Co.)

D. McLennan, Clerk (St. Anthony Lumber Co.)

Ernest Pitt, Secretary, 58 Queen St., Ottawa.

The membership fee is only two dollars per annum, and the Secretary will gladly furnish any desired information to persons who may be desirous of joining the Club.

D. McLENNAN, Clerk, (St. Anthony Lumber Co.) ERNEST PITT, Secretary.
WM BURNS, Book-keeper, (Fraser & Co.) WM. VAUGHAN, Agent, (Fraser & Co.) THOS. REYNOLDS, Foreman, (McLachlin Bros.) HENRY W. LINK, Culler, (Hawkesbury L'b'r Co.)

OFFICERS OF THE LUMBERMEN'S CLUB OF OTTAWA.

DOMINION FORESTRY WORK.

Mr. E. Stewart, Dominion Superintendent of Foresty, returned to Ottawa a short time ago from the west, where he had been for three months looking after the work of his department. He reports that the forest rangers have done splendid service. The forest fires in British Columbia and especially along the Crow's Nest Pass, in Western Alberta, have caused a considerable loss, but in the other districts the destruction of timber has not been great. In connection with the system of co-operation with the prairie settlers in growing forest trees on their homesteads, nearly 2,000,000 trees were sent out to settlers this season. These have up to the present been mostly grown from seed on the experimental farms at Brandon and Indian Head, but it was found advisable to centralize this work at one place, and 160 acres about a mile south of Indian Head Station were selected. Buildings have been erected, about fifty acres got ready for cultivation and considerable seed sown. This will not only permit the Forestry Branch to grow a large number of trees for annual distribution, but will also be a model forest nursery station where experiments can be conducted with all varieties of forest trees suited to this northern climate. As the farms of the applicants for trees are all inspected and thorough preparation of soil and care in planting insisted on, these plantations, which are scattered here and there from the Red River to the foothills of the Rocky Mountains, will furnish object lessons on proper methods in this line of work to the people throughout the prairie districts.

The staff of the Forestry Branch consists of the superintendent, assistant superintendent, two other regular assistants, four inspectors of tree planting employed during the summer, and about forty forest fire rangers. The appropriation for the past year was $40,000.

UNIQUE LOGGING RAILROAD.

The Allen & Nelson Mill Company, whose mill is at Monohan, King County, Wash., operate probably the most unique logging railroad in the country. The road is about two and one-half miles long and has been successfully worked for the last three or four years and is said to be a success.

While both road and rolling stock might be said to be nondescript, they are money savers and money makers. The locomotive or motive power is nothing more than an upright boiler on an improvised car and furnishes steam to a double engine that in like improvised manner is rigged up to operate a double set of drive wheels by the help ot cog wheels and endless chains.

The cars for hauling the logs are even more unique, but they work charmingly. Four sets of wheels are rigged up in four frames that enclose them and a short axle passes from one side of the frame to the other, so that each wheel is held independently of all others. The four frames are held rigid by 12 × 12 timbers fastened to them on top and upon these cross timbers are laid other long 12 × 12 timbers that help make up the frame work of the car and hold the logs. The locomotive and the log cars have flanged trucks that run upon a wooden rail made out of logs and embedded in the ground to keep them in place. The trucks under the engine have a play of several inches on the axles to prevent them from leaving the rails when going around curves and for the same reason the trucks under the log cars are built upon the short axles.

The log car is twelve feet wide and twenty average-sized logs are taken out of the woods at each trip, but one car being in use at one time. The "train" makes four trips daily, moving about 25,000 feet in that time. The engine negotiates a "down grade" of 18 per cent. with its load by reversing the steam and the appliance of brakes on the log car operated with block and tackle. The road is now being extended so that some up grades are encountered in taking the logs out to the mill and the assistance of the donkey or yarding engine will have to be called into play to get the loaded car up. The engine is able to take the empty car back over any of the grades so far encountered.

This manner of logging is said to be cheaper than by the use of horses or any of the more modern appliances. Very little steel or iron enters into the construction of the road and the material being nearly all at hand in the woods around, it is simplicity itself and the essence of economy. — Pacific Coast Lumber Trade Journal.

DR. JUDSON F. CLARK.

The announcement was made in a previous issue that Dr. Clark had been appointed Provincial Forester by the Ontario Government as a member of the staff of the Crown Lands Department. Dr. Clark having now entered upon his duties, we present his portrait and give some particulars of his educational career and forestry experience.

Judson F. Clark, B.S.A., A.M., Ph.D., was born at Bay View, Prince Edward Island, in 1870. After spending a year at Prince of Wales College, Charlottetown, he entered the Ontario Agricultural College at Guelph, where he won the gold medal for general proficiency in 1895, graduating in 1896. The following two years were spent as a member of the teaching staff of the college, after which he entered Cornell University, Ithica, N.Y., for the study of forestry and physiological botany. He received the degree of A.M. and was appointed assistant in botany both in the regular course and the summer school in 1899. The following year he was appointed Fellow in botany, and graduated as Doctor of Philosophy in 1901, when he was at once appointed Professor of Forestry in Cornell, with leave of absence to study forestry in Germany. He resigned from the staff of Cornell on the veto of the annual appropriation for the College of Forestry in 1903 by Governor Odell, and was appointed to a position on the staff of the National Bureau of Forestry at Washington, D.C., which position he resigned to undertake his new duties with the Ontario Government.

When in Germany Dr. Clark devoted most of his time to practical investigations in the forests, but before returning he spent one month visiting the forestry schools for the purpose of becoming acquainted with forestry teachers and of studying their methods of school work. During this month he visited, with one exception, every forestry school in Germany and Switzerland. The curricula of the forestry schools in Germany, he states,is almost entirely theoretical, the student depending for practical training on the experience gained in minor positions after graduating.

While associated with Cornell University, Dr. Clark had charge of the courses in forest measurements, forest mapping, and wood technology, and assisted in the courses in silviculture, forest protection, and forest administration. Three months of each year were devoted to practical forest mapping, timber estimating, and silviculture in the Adirondack Mountains. The work in the mountains affording as it did ample opportunity for practical work and study of actual woods conditions at first hand was, he considered,a very important feature of the school work. The majority of the graduates of this forest school have been employed by the United States Government, either as members of the staff of the National Bureau of Forestry or in the Phillipine Forestry Service. A number, however, have been employed by practical lumbermen in connection with the management of their timber lands.

The experience of Dr. Clark while connected with the Bureau of Forestry will no doubt be found of great value to him in his work in Ontario, for the conditions found in the States in which his investigations were made are in many respects similar to those in this province. The first four months were spent in the White Mountains in New Hampshire investigating a proposition to establish a national park in that region, his duties including a study of the existing stand of timber, its present amount, the rapidity of growth, natural regeneration of timber trees, and the question of protection, especially protection from fire. Some attention was also given to the study of lumbering conditions. Later, he was assigned to the making of preliminary examinations of timber land tracts for which application for working plans had been made to the Bureau of Forestry, and to examine and advise on the management of farmers' wood lots. This work was carried on in the States of Ohio, Michigan, New York, New Jersey, and all the New England States, with the exception of Rhode Island.

By close observation and careful study Dr. Clark has acquired a knowledge of the subject

DR. JUDSON F. CLARK,
Provincial Forester for the Ontario Government.

of forestry which especially fits him for his present position. While possessing the requisite scientific training for the further development of the Provincial forest policy of keeping a valuable crop of trees growing, wherever practical, on non-agricultural lands, he is in the fullest sympathy with the lumbering interests, which he regards as constituting the most important department of any practical system of forestry. We may therefore feel assured that in any modification of policy which he may recommend, the interests of the timber limit owner as well as the public at large will be protected as far as possible.

LOG FREIGHT RATES CONFIRMED.

The United Factories, of Newmarket, applied to the Railway Commission for a reduction in the freight rate charged by the Grand Trunk Railway for carrying logs between Penetanguishene and Newmarket. The rate now charged is four cents per 100 pounds. The application was refused, the Board contending that the old rate of three cents was not profitable to the railway, but a temporary expedient to encourage carriage to the new industry at Newmarket. For the same distance on other portions of the Grand Trunk 7½ cents per 100 pounds is charged, and against this rate no complaint had been made. The Board thereforé concluded that the present rate was moderate.

Trade Opportunities

CANADIAN COMMERCIAL AGENTS.

AUSTRALASIA.

AUSTRALIAN REPORT.

Mr. D. H. Ross, of Melbourne, Aus., reports to the Department of Trade and Commerce as follows:

CANADIAN TIMBER.—Five ships are now on voyage from Canada to Melbourne—four having sailed from St. John—with cargoes of spruce. Stocks held locally are not very extensive, and fair sales are being made. Further shipments are anticipated before the end of this year, as the building trade is more active in Melbourne than it has been for years past.

DOORS, SASHES AND MOULDINGS.—To a British Columbia manufacturer of doors, etc., has been forwarded full particulars of the local markets. The Commonwealth customs duties are: Mouldings, 84 cents per 100 lineal feet; sashes, 20 per cent. ad valorem; doors, 84 cents, $1.20 and $1.80, according to thickness. With freights and duties to contend against there is little prospect of business being done, and then only when the mills are at the port of shipment.

ENQUIRIES RECEIVED.

From the High Commissioner of Canada, London, England: (1) A London firm wish to hear from a few reliable manufacturers in Canada of pure maple dowels, rounded and smooth, 32, 34 and 36 inches long and 7-16th to 14-16th inch diameter. (2) Inquiry is made by a London firm for names of good, reliable makers in Canada of oak panelling and similar goods.

From P. B. Ball, Birmingham, England: A commission agent in the Midlands wishes to take up an agency for window frames, doors, &c.

From P. B. McNamara, Manchester, England: A Manchester firm doing a large trade throughout England desires prices c.i.f. Manchester from Canadian firms making clothes-pins, towel-rollers, doors and flooring.

From Curator, Canadian Section, Imperial Institute, London, England: A company in Glasgow is in the market for a quantity of lumber in the log (elm suggested) suitable for bands and handles of cheap fruit baskets. Cutting to be done with a rotary veneer cutting machine from about one-eighth (⅛) inch thick.

By the Department of Trade and Commerce, Ottawa: A firm of timber merchants in Leeds, England, desire the names of Canadian manufacturers of three, five and seven ply wood.

The names of the firms making the above inquiries, with their addresses, can be obtained upon application to the Superintendent of Commercial Agencies, Department of Trade and Commerce, Ottawa.

CAPACITY OF PORTABLE SAW MILLS.

In the Wood-Worker E. L. Mason tells of an 8-h.p. mill turning out from 4,000 to 6,000 feet per day with two men, a sawyer and fireman, the sawyer turning and placing his own logs and the fireman doing the off-bearing. Concerning this a correspondent says: Mr. Mason may have been informed by some one that the mill in question did this amount of work, and believed every word of it. We often hear of how much lumber a certain mill can cut in a day. No matter what owner or sawyer you may ask the question, he will undoubtedly give you his best day's run, never referring to the poor ones. But under the most favorable circumstances, with selected logs, etc., there is not a sawyer (Mr. Mason included) who would undertake to do this amount of work with an 8-h.p. engine and one man to assist him.

I have spoken to several sawyers about this, and they all think Mr. Mason should cut one cipher from his figures; they could believe the rest. If Mr. Mason's sawyer can do what he claims, I am willing to send a certified check to the editor of this paper, for any reasonable amount, he duplicating it, for all mill men in this section are willing to take all bets of this kind at any time. We will allow his expenses to New Jersey from anywhere. He can travel in a pullman and bring his valet with him, and live retired if he can make good his claims.

How much lumber to each h.p. will a circular saw mill cut? This is a question often asked mill men and the manufacturers of saw mills. The manufacturer will generally tell you a 10-h.p. engine ought to saw from 3,000 to 5,000 feet per day. Mills from 30 to 40-h.p. ought to run 1,000 feet to each h.p., and mills of larger power ought to run more than 1,000 feet to each h.p., as the friction is proportionately less in large mills than in small ones. The power required to keep up the momentum of a small mill, we will say, for instance, 10-h.p., and that required for one of 20-h.p., would be in proportion to their size and weight, but the leverage or friction of the saw while in the log would be nearly the same on each mill while running at the same speed, and while the larger mill would stand additional feed, the advantage would be all in the large one's favor. The 20-h.p. mill should cut twice the amount of lumber per day as a 10-h.p. mill will cut. But this rule of proportion dare not be carried beyond a certain limit, the reason being that the 10-h.p. mill is altogether too small for saw mill purposes and will not stand enough feed in large logs, or even medium ones, to keep from heating the saw, causing loss of time and very often poor lumber.

I refer only to the capacity of mills without edgers, etc., where the sawyer is obliged to cut everything to size, and not simply take off the slabs, the edger and resaws doing the rest. There is one point the manufacturer overlooks, and that is, how much longer time does it take to place and turn a log on a 20-h.p. mill than to do the same labor on a mill of 30 or 40-h.p.? The labor is one and the same, no matter how great or small your power may be, where the labor is done by hand. The time consumed in placing logs on mill, turning, gigging back and setting out for the next cut far exceeds the time saw is in the log, which is the only time much power is needed.

As an illustration, the other day we placed and cut a 12-foot log which cut 172 feet of lumber. The saw was in the log 139 seconds out of 12 minutes' total time consumed. Taking only the time the saw was in the log, this engine of 20-h.p. cut 1.237 feet per second, or 44,532 feet for ten hours' work. Taking total time consumed (12 minutes), would bring this down to 8,600 feet for ten hours. Now, if a 40-h. p. mill would stand twice the amount of feed, we would save one-half of 139 seconds, or 69½ seconds, or about one hours' work per day, which would mean, with the larger mill, about 900 feet more lumber. This log cut easily. I do not wish to convey the impression that our mill would cut 8,600 feet each day, though it would if all logs were alike and sawed into the same sizes, no doubt. Other observations taken on this subject will be continued in next issue.

CONTRIBUTIONS INVITED.

The publishers of this journal will be glad to receive at all times contributions on any subjects affecting the lumber trade, such as the method of operating saw and planing mills, arrangement of machinery, best method of piling lumber, or any other practical question of interest. Such contributions will be appreciated and will assist in making the journal of greater value to its subscribers.

The will of the late Alexander Lumsden, ex-M. L. A., lumberman and steamboat owner, of Ottawa, has been probated. The value of the estate is placed at $935,042. It is made up as follows: Ontario real estate, $41,175; personal estate, $484,918.44; Quebec real estate, $408,947.26.

IMPORTS OF FOREST PRODUCTS

The following table shows the value of the products of the forest imported free of duty into Canada from the United States during the months of March, April, May, June, July and August, 1904. The table is compiled from the unrevised monthly statements of imports and exports issued by the Department of Trade and Commerce:

Class of Timber.	March. Value.	April. Value.	May. Value.	June. Value.	July. Values.	August. Values.
Sawed or split boards, planks, deals, &c.	$207,405	$260,904	$236,800	$388,904	$267,681	$300,349
Logs and round unmanufactured timber.	29,894	11,062	17,885	84,487	46,185	58,376
Timber, hewn or sawed, square or sided	6,489	29,967	11,705	46,005	25,019	42,706
Cherry, chestnut, hickory & white wood	45,861	42,633	55,561	48,625	35,482	33,258
Oak	122,823	137,252	125,926	164,382	129,177	107,143
Pitch pine	14,887	19,562	29,745	69,401	7,995	10,387
Mahogany	4,342	15,259	5,885	6,840	1,480	2,528
White ash	15,279	9,770	14,469	10,155	4,330	8,948
Walnut	2,855	9,259	4,161	4,616	1,904	4,290
Spanish cedar	322	313	317	.....	.....	.....
African teak	1,498	316	139	586	593	1,730
Pine and spruce clapboards	1,651	747	361	18	1,264	771
Laths	3,335	7,379	4,825	10,139	3,300	1,899
Shingles	1,621	3,058	693	976	1,588	777
Staves	16,502	8,013	15,011	8,465	8,384	9,433
Shovel handles	6,520	2,209	2,698	7,370	2,178	3,054
Felloes of hickory, rough sawn to shape	1,936	2,560	4,412	2,834	3,389	4,582
Handle, heading, stave and shingle bolts	4,136	1,526	4,291	381	4,404	2,808
Hickory billets	555	79	110	979	597	.....
Hickory for spokes of wheels	390	253	244	76	.....	107
Hickory spokes, rough turned	27,279	29,860	18,027	22,144	12,582	12,470
Hubs for wheels, posts, last blocks, etc.	4,219	2,596	3,287	4,138	1,738	3,288
Fence posts and railroad ties	4,346	13,572	8,830	28,693	24,831	28,839
Total	$524,265	$60),169	$625,382	$910,214	$584,101	$638,743

EXPORTS OF FOREST PRODUCTS

The following table shows the value of the products of the forest exported from Canada to the United States during the months of March, April, May, June, July and August, 1904. The table is compiled from the unrevised monthly statements of imports and exports issued by the Department of Trade and Commerce:

Class of Timber.	March. Value.	April. Va ue.	May. Value.	June. Value.	July. Value.	August. Value.
Planks and boards	$205,830	$347,191	$523,091	$1,572,224	$747,815	$1,061,356
Basswood lumber	332	756	425	1,866	352	3,140
Pine deals	237	1,338	7,890	7,508	19,250	30,923
Spruce and other lumber	.....	12,696	7,819	15,227	13,163	33,491
Laths	28,391	29,857	54,830	135,431	1,337	92,163
Pickets	238	341	6,245	18,586	8,289	12,290
Scantling	3,387	1,698	16,230	16,267	14,919	15,754
Shingles	75,378	136,429	153,137	252,697	126,302	134,858
Shooks	1,605	379	6,943	7,250	5,523	4,060
Staves and headings	4,217	4,256	8,382	12,840	19,336	15,332
Telegraph and other poles	1,155	4,924	1,990	6,205	5,360	3,653
Cedar and tamarac posts	.....	1,397	2,262	7,856	1,122	1,543
Shingle bolts	500	138	350	180	24	60
Sleepers and railroad ties	5,816	12,493	14,327	34,496	19,195	15,580
Stave bolts	701	113	163	930	320	519
White pine timber	574	.....	.....	25	255	472
All other square timber	431	507	265	808	209	2,030
Pulp wood	117,229	142,204	163,225	277,531	261,862	323,409

BRITISH COLUMBIA SAW MILLS

Photographed and Described by Our Travelling Representative.

THE EAST KOOTENAY LUMBER COMPANY.

The East Kootenay Lumber Company is a combination of three concerns, the Park Mitchell, operating on Moyie Lake; the Cranbrook Lumber Company, operating at Cranbrook and Palmer Bar, six miles west; and the McNab Lumber Company, operating at Jaffray. In 1902 these companies were amalgamated under the name of the East Kootenay Lumber Company, with headquarters at Cranbrook. The mills operated by this company have a combined capacity of over 42,000,000 feet annually and constitute one of the largest lumber plants in the East Kootenay section of British Columbia. The company own in their own right over 40,000 acres of fine tamarac, pine and fir, while they have a ten year lease on 175,000 acres of C.P.R. lands. All their limits are located on the Moyie and Kootenay rivers.

East Kootenay Lumber Company's Mill at Cranbrook, B. C.

The Park Mitchell mill occupies a site of fifteen acres on the Moyie river at Ryan, thirty miles west of Cranbrook, the main line of the Crows Nest Pass Railroad running right through it. The plant consists of a saw mill, tie mill and planing mill. The main building is 45 × 120 feet and is equipped with the latest improved machinery, including circular, twin saw for ties, bevel edgers, trimmer, slash table and two planers. Power is supplied by two 60″ × 16′ Leonard boilers and one 20 × 24 Hamilton engine, while a dynamo and engine provide light for the mill and yard. The capacity is 50,000 feet of lumber on the circular side and 2,000 ties per day.

The Palmer Bar mill, one of the Cranbrook Lumber Company's properties, is a small portable mill with a capacity of 15,000 feet per day.

The Cranbrook mill is situated on a site of ten acres adjoining the tracks of the Crows Nest Pass Railroad at Cranbrook. It is a circular mill with a capacity of 35,000 feet of lumber daily.

The Jaffray mill occupies a site of twenty acres, one and a half miles west of Jaffray depot, on the Crows Nest Road. It too is a circular mill equipped with the most modern machinery and possessing a manufacturing capacity of 40,000 feet of lumber per day.

The entire output of the four mills is marketed in Manitoba and the North-West Territories, the company doing a very large business in railroad ties with the C.P.R., having the contract for supplying the entire prairie section of that company's lines. It is estimated they are among the largest railroad tie manufacturers in the Dominion. Some idea will be gained by the reader of the vastness of the shipments of ties for the C.P.R. last year when it is known that it took 250 train loads, consisting of 16 cars to the train, to carry them to their destination on the prairies. The excellence of the company's product is so well known and so vast has become the increase in the demand for their lumber that they are now considering the advisability of further extensions. Visitors are always welcome to inspect the company's various plants and they will find much to admire in the bright and spacious offices, the clean, airy stables and the neat and well-kept appearance of the different plants.

The company has been particularly fortunate in securing for its management Mr. A. Leach as president and Mr. W. Colpman as manager. They are both particularly energetic and capable business men and are favorably known as men of sterling qualities, securing for them the esteem and respect of Cranbrook and the entire Kootenay country. As evidence of their shrewdness of management they have surrounded themselves with energetic and capable employees who are as proud of the growth of the institution and as solicitous for its continued prosperity as they are themselves. Both are experienced lumbermen and take a prominent part in the affairs of the British Columbia Mountain Lumbermen's Association, whose headquarters are in Cranbrook.

East Kootenay Lumber Company's Mill at Jaffray, B. C.

W. C. WELLS.

Situated at Palliser, at the foot of the Rockies, twelve miles east of Golden, on a level park-like expanse of greensward in the valley of the roaring Kicking Horse, lies the neat little mill owned by W. C. Wells, late member of the Provincial Cabinet at Victoria. All around are lofty snow-clad peaks, which coupled with the surpassing loveliness of the valley and the rush of the sparkling waters of the swift-flowing river, cannot fail to cause the traveller to pause, lost in wonder and amazement.

The plant consists of a saw and planing mill erected in the year 1886, just after the passing through of the Canadian Pacific Railway. It was at first only intended to run on a small scale for the purpose of cutting and marketing the surrounding limits, but since the great Northwest began to grow in population with such rapid strides, the demands made upon the output, both on account of the excellence of the lumber and the nearness to the market, have been so great as to necessitate a vast increase in the capacity, so that today the visitor finds a fair-sized mill with an output of 50,000 feet per day. It is equipped with the most modern machinery and all the known specialties of the day.

On account of the dryness of the atmosphere it has not been found necessary to erect a dry kiln, the lumber being piled in the yards and rapidly dried by the scorching rays of the hot sun.

Mr. Wells owns 10,000 acres of fir, cedar and spruce, the cut of which is driven to the mill after a course of fifteen miles down the Beaverfoot and Kicking Horse Rivers. His dimensions, boards, ship lap, flooring, ceiling, siding and mouldings are in great favor all through the Territories and Manitoba, where the entire output is marketed.

Despite the depressed condition of the trade generally in the Province, the demands made upon the mill have become so vast during the

past few months that Mr. Wells has finally decided to double the capacity of the mill by putting in a large gang saw, additional planers and one boiler to increase the power. He purposes spending about $12,000.

Mr. Wells is well-known in public as well as lumber circles, having represented the Golden district for the last six years in the Provincial House and being elected to the Cabinet during three successful administrations. During the past few years he has allowed his son, Mr. Geo. P. Wells, to manage the more active part of the business. That George, as he is popularly known by the surrounding inhabitants, has succeeded in keeping up the high standard of excellence set by his father, is strong evidence of the sterling qualities he possesses. He is ably assisted by Mr. W. A. Anstie as secretary and book-keeper.

East Kootenay Lumber Company's Mill at Ryan, B. C.

THE GREAT NORTHERN LUMBER COMPANY.

The above company was organized in December, 1903, in Vancouver, with W. D. S. Rorison as president, R. D. Rorison as manager and Wm. M. Loree as vice-president. With ample capital to work with they purchased the mill, logging outfit and timber limits of A. D. Bell, the mill being situated on False Creek and possessing first-class transportation facilities both by rail and water.

The mill as it stands at present is 22 feet long by 80 feet broad and possesses a capacity of 10,000 feet per day of ten hours. This output, however, is much too small to satisfy the enterprising gentlemen at the head of affairs, they already having contracts out for a new mill which is to be 40 feet by 100 feet and equipped with thoroughly modern machinery. A large dry kiln, 20 feet broad by 120 feet long, is also to be constructed for the purpose of storing the lumber as it is manufactured. The capacity of the mill when completed will be 20,000 feet per day of ten hours.

Unlike any other mill in British Columbia, the motive power is derived from an 80 horse-power electric motor, the current being carried along the wires of the Vancouver Power Company from Lake Beautiful. The company market nearly all of their lumber in the eastern markets—Ontario, Manitoba and the North-West.

The wood-working plant of the Sydney Manufacturing Company, Limited, of Sydney, N.S, is offered for sale.

THE ABBOTSFORD LUMBER COMPANY.

The above company's mill is situated on the Sumas branch of the Canadian Pacific Railway, in the centre of the big tree district and three miles from the boundary of the State of Washington. Trains leave Vancouver every morning at 9 p. m. for Seattle, leaving the main line at Mission Junction and passing right through the centre of the company's property. All the way from the junction down to the mill one can get a pretty good idea of the class of lumber that Messrs. Cook, Johnson & Craig handle by enormous stumps standing near the railway.

The company possess almost 4,000 acres of such timber, which is mostly fir, and with such an asset to draw upon they have made use of the opportunity to manufacture heavy bridge timber, their product being in great favor throughout Manitoba, the Territories and the East.

The plant consits of a saw mill, planing mill, dry kiln and storing and loading sheds. The saw mill is 120 x 35 feet and is equipped with carriage, top and bottom saw, three saw edgers, trimmers and one planer. Driving power is obtained from one boiler 60" x 16 feet and two Waterous engines. The capacity is 20,000 feet per day.

Constructed in 1902 and owned by Messrs. Smith & Johnson, it was taken over by a joint stock company in the early part of this year. Vast improvements have been added since, the dry kiln having been built, another engine installed in the boiler house, and a top saw and edger added to the equipment of the mill machinery.

All three directors are experienced lumbermen, Mr. Cook being the former manager of the Whatcom branch of the Hastings Shingle Mill Company.

Saw Mill of the Abbotsford Lumber Company, Abbotsford, B. C.

JOSEPH CHEW'S SHINGLE MILL.

In Vancouver there are several large mills turning out red cedar shingles by the million yearly, and among these is that owned and operated by Joseph Chew and established four years ago. His well and modernly equipped plant is located at the foot of Cambie street, on False Creek, occupying nearly 300 feet of water front and being bounded in the rear by the C.P.R. tracks, affording it unsurpassed shipping facilities.

Mr. Chew owns 7,000 acres of red cedar, fir and spruce, the manufactured product finding a ready market in all the provinces, while large stocks are shipped yearly to Australia. He estimates his output at 100,000 a day and from 25 to 30 million yearly, over 13 million of this going to Ontario.

The main building is 32 × 75 feet and is equipped with two Boss machines manufactured by B. R. Mowry & Son, of Gravenhurst, Ont., while Letson & Burpee recently installed two Dunbar machines.

The boiler house, 40 × 30 feet, stands away from the mill and is constructed of non-combustible material, while it is equipped with one large boiler of 100 h.p. and one engine.

A new dry kiln 20 × 100 feet is one of the latest additions to this thoroughly up to date mill.

How accommodating are our English cousins. When we need all of our spruce lumber here at home they considerately withdraw from the market and let us have it.—Lumbermen's Review, New York.

Foreign Subscription, $2.00 a Year.

ADVERTISING RATES ON APPLICATION.

THE CANADA LUMBERMAN is published in the interests of the lumber, wood-working and allied industries, being the only representative in Canada of these important interests. It aims at giving full and timely information on all subjects touching these interests, and invites free discussion by its readers.

Especial pains are taken to secure for publication in the WEEKLY LUMBERMAN the latest and most trustworthy market quotations throughout the world, so as to afford to the trade at home and abroad information on which it can rely in its operations. Subscribers will find the small amount they pay for the CANADA LUMBERMAN quite insignificant as compared with its value to them. There is not an individual in the trade, or specially interested in it, who should not be on our list, thus obtaining the present benefit and aiding and encouraging us to render it even more complete.

Advertisers will receive careful attention and liberal treatment. For manufacturing and supply firms wishing to bring their goods to the attention of owners and operators of saw and planing mills, wood-working factories, pulp mills, etc., the CANADA LUMBERMAN is undoubtedly the cheapest and most profitable advertising medium. Special attention is directed to "WANTED" and "FOR SALE" advertisements, which are inserted in a conspicuous position on front page of the Weekly Edition.

CURTAILMENT A WISE POLICY.

It is only natural that a manufacturer of lumber should endeavor to secure a return as large as possible from his invested capital. If he did not aim at so doing, he would be neglecting the essential point for which all business exists. The methods adopted to obtain the most remunerative results are in some instances questionable, and perhaps the most common mistake is the idea that a mill must at all times be operated to its maximum capacity. Quality is too often made subordinate to quantity, with the result that much badly sawn lumber is put upon the market and the producer realizes a smaller sum for his raw material in manufactured condition than if the same material had been carefully sawn.

Granting that the quality of the lumber can be maintained when the mill is operated to its utmost, it does not follow that a restriction of the output is not often a wise policy to be pursued. The manufacturer who adopts such a course will seldom be found with heavy stocks which he cannot dispose of, nor is he likely to feel the effects of the periodical depressions in the trade as keenly as his confrere who has been forcing the capacity of his mill. He may not make as much money in times of abnormal prosperity, but at all other times the financial balance is likely to be in his favor. His policy will sustain the stability of the market for a longer period, while at the same time conserving his timber supply.

The British lumber market, which has been in a depressed condition this year, would probably have weakened to a much greater extent but for the policy of curtailment which has been adopted by the exporting countries. Holders of lumber have thus been assured that no large surplus stocks would be dumped upon the market next year, and have therefore been encouraged to sustain prices. Canadian manufacturers have been among the leaders in this movement and are to be strongly commended for their action. If we might offer a word of advice, it would be that they adhere strictly to their agreements and curtail the production of logs as much as possible. In this respect they cannot be too sincere for the good of the trade.

Unfortunately, the situation in British Columbia has not improved, and the solution would seem to lie in limiting the production and in co-operative effort towards the regulation of the futue output. The closing down of all the mills for a briet period at least would probably be a wise step.

THE DEALER A NECESSITY.

The dealer in lumber—whether wholesale or retail—is not as a rule given as much credit for his work as he is entitled to. That his position has been improved as compared with earlier days is quite true, but there is still a disposition to regard him as existing in some measure for the purpose of usurping the profits which would otherwise go to the manufacturer. This is far from the real facts, and the sooner the idea is entirely dispelled the sooner will the relations between buyers and sellers of lumber become more harmonious and the business proceed along more natural lines.

The dealer is a very necessary agent between the manufacturer and the consumer, and, if given opportunity, is likely to be of assistance to both. It may be possible for the manufacturer to do a successful business by selling direct to the consumer, but his annual inventory is likely to show heavy losses by reason of extending credit to persons of whose standing he had little or no knowledge, and it is very doubtful that a lumber business could be conducted on a strictly cash basis.

In addition to seeking to develop new markets for the mill product, the dealer assumes the position of financial guarantor to the manufacturer. He pays the manufacturer cash in, say, sixty days, whereas he may be obliged to carry the consumer's account for six months or a year. The manufacturer is therefore able to do business on a smaller capital than if he were extending credit to a large number of customers. Besides, the dealer is acquainted with local conditions in a manner that the manufacturer could not possibly be, and, knowing the doubtful accounts, will exert his best efforts to prevent loss.

It is true that a dealer may become involved and a loss be thus incurred by the manufacturer, but with the number of his customers circumscribed the danger is greatly minimized.

It is not easy to indicate the line which should mark the legitimate field of the dealer. This has been under discussion for some years in the United States and has not yet been satisfactorily settled, but there is a growing disposition there to protect the dealer as far as possible, experience having proven that nothing is gained by passing him by.

The withdrawal of the Mountain Lumber Manufacturers' Association of British Columbia from the honorary membership list of the Western Retail Lumbermen's Association was followed by rumors that the manufacturers had decided to ignore the retailers as a body and sell direct to consumers. The difficulties which such a plan would involve are very apparent, especially when it is considered that the settlement of the North-West is of recent development and that new comers are daily being added to the list of lumber consumers. It is therefore very satisfying to be assured by the Secretary of the Mountain Manufacturers' Association that the rule generally recognized throughout all manufacturing industries in Canada, to sell to the trade only unless perhaps in some exceptional cases, will still be observed.

ADVANCE OF THE MUTUAL INSURANCE MOVEMENT.

The decision of the Canadian Manufacturers' Association to establish a fire insurance department covering mercantile risks is but an outcome of the growth of popular sentiment in favor of mutual insurance. The Canadian insurance companies having made a material advance in their rates, and this additional expense having borne heavily upon the manufacturers, a committee was appointed to make an exhaustive investigation into the causes for such increase and to suggest some means of securing relief. The finding of this committee, in the opinion of the members of the Association, warranted the organization of an insurance department, which is now in process of formation.

The investigations of the committee seem to show that the old line companies are doing a profitable business notwithstanding that they are operating under excessive fixed charges. The premiums on fire insurance in Canada have been steadily increasing and are now very high. The average rate on all policies written by the companies doing business in 1898 was 1.26 per cent., and in that year 34.91 per cent. of the premiums was distributed for expenses of management, reserve fund and dividends. In 1902 the rate of premium had increased to 1.47 per cent., and 61.74 per cent. of the premiums went for the purposes above named. For thirty-four years the companies collected in premiums $62,250,192 more than they returned in losses, which amount is 32.5 per cent. of their total premium income. For the last eight years the percentage was 36.34 per cent.

The figures obtained by the committee do not show that insurance in Canada has been unprofitable, as in 1902 the dividends of the ten companies doing the largest business ranged from 5.9 per cent. to 90 per cent. on the paid-up capital, the average dividend paid by these companies being 26.43 per cent.

The weakest point in the methods employed by the regular companies is stated to be their system of inspection, which is little more than a name. The person with a good risk is compelled to help pay for his neighbor with a poor one, which is doubtless a very wrong policy, as it does not encourage as it should the protection of property.

The Association will endeavor to have each

risk stand on its own merits and will collect the premiums on the basis of scientific inspection. It is proposed to eliminate commissions reduce expenses and return profits to policy holders, and the basis of fixing premiums is intended to offer every encouragement to the insuring public to protect their own property.

Some lumber manufacturers who are members of the association will probably take advantage of the facilities thus offered, although the lumber mutual insurance companies are doing a great deal in the way of providing equitable insurance on lumbering property. The success of these companies in the United States has been little less than phenomenal. The Lumber Mutual Fire Insurance Company, of Boston, are now paying 30 per cent. dividend to policy holders, and it may be that other companies have accomplished results equally as favorable.

EDITORIAL NOTES.

The British Columbia Government recently seized some logs and logging equipment of persons who were operating on the Nicomekl river, on the ground that payment of the export tax imposed by the Government had been evaded. The royalties were paid under protest, and it is understood to be the intention of the interested parties to test the constitutionality of the law placing an export tax on logs. On the other hand, the statement is made that the parties were cutting timber on lands within the Dominion railway belt which are not liable to the provincial tax, and that there are a few stretches of land along the Nicomekl river the titles to which were granted by the Provincial Government before the transfer was made to the Dominion Government, the timber thus being subject to the export royalties. The logging firms consequently made the mistake of assuming that the lands upon which they were operating were under the control of the Dominion Government. The situation is interesting, as many believe that the Government was being wilfully cheated.

The proposal of the Canadian Manufacturers' Association to have an excursion to Great Britain next summer is a very commendable idea and likely to be heartily supported by the members. Notwithstanding that Great Britain has learned much of Canada in late years, there still exists but a vague idea of the extent of our manufactories. There are in Canada about 15,000 manufacturers, 1,500 of whom, including the most progressive firms, are members of the Canadian Manufacturers' Association. A visit to Great Britain by such a representative body of business men would doubtless have far reaching results, not alone in the extension of our foreign trade, but in promoting a closer alliance between the people of the two countries. That the trip would be a pleasureable one is assured by the offer of the representatives of the London Chamber of Commerce to give their services to make the excursion a success from the time the members arrive until their departure. It is hoped that the excursion may be arranged for and that every manufacturer who can do so will take advantage of it.

VIEWS AND INTERVIEWS

Speaking particularly of the white pine market, a prominent manufacturer said : "Three things are in favor of a firm lumber market in the United States, namely, cheap money, good crops, and low stocks, and under these conditions the Americans do not go to sleep." Probably before this issue reaches the reader, the Presidential election across the line will be a thing of the past, and there is little doubt that the present incumbent will be returned to office. The tariff is therefore likely to remain practically unchanged for another four years, and there is a disposition to expect that the favorable conditions above mentioned will sustain the white pine market and probably cause a hardening of values at a little later date.

* * *

During the past three or four years the labor account has beena very heavy burden upon lumbermen, while at the same time it has no doubt exerted a sustaining influence on lumber prices. The advance in the wages of woodsmen does not by any means represent the increased amount expended for labor in getting out logs, for instead of the better pay being considered by the men an incentive to do a good day's work, the reverse seems to have been the case to an almost incredible extent. "It seems very singular," remarked Mr. W. A. Charlton, M.P.P., to the writer a few days ago, "but it is a fact that two men when wages were $22 per month would do more work than three men when wages are $35 per month. When they are getting $22 per month they are anxious to keep their positions, while at $35 they are independent." Mr. Charlton has given some attention to the labor question and claims that the results have worked out as above stated. His views coincide with those expressed by many other lumbermen, who have been compelled of late years to employ much larger crews of men to get out their usual cut of logs. Another item of expense in this connection has been due to "jumpers" abandoning work after their railroad fares had been paid. In one or two instances, however, these "jumpers" have been severely punished, which may have the effect of suppressing the habit.

* * *

There is no brighter mind in the lumber trade than Mr. R. H. Alexander, manager of the British Columbia Mills, Timber and Trading Company, of Vancouver, B.C. He is one of the most active and influential members of the Pacific Coast Lumber Manufacturers' Association, and at a recent meeting of that body expressed the following views on the cargo branch :

"You will agree with me that the close association work of two years ago in a great measure produced the satisfactory results and the good trade that followed. The time was propitious and the efforts to raise prices was of course assisted by these conditions, but the manufacturers would not have been in position to take advantage of these good times had not the association been formed and materially assisted in the work. Times were good but the lumbermen were not receiving good prices for their product. We started in with the association work and the results were most satisfactory and of great value. Then we concluded we could draw the lines a little closer and raise prices, and I am sure that that action becoming known through other trades was fruitful of good times and good prices.

"When the association disbanded prices fell away at once and to a worse condition than has ever been known for a number of years. I am convinced that these conditions will continue unless some concerted action is again taken on the part of the manufacturers to get together and improve them.

"Why should prices be less than then?

"The volume of business shows to be better. A very small percentage of difference exists between the first six months of 1903 and 1904, a decrease of only 9,000,000 feet in a total of 883,000,000 feet. Why should this small difference result in cutting prices in half? We have heard no complaints of the prices of our products. In fact in some markets they would be better satisfied with the higher prices than with the low. Neither were the prices so high that it brought other lumber into the field or stopped the use of lumber.

"There is but one reason why the mills of the North Pacific Coast are getting the low prices for their lumber that they are, one fault and that is ourselves—lack of association and harmony to work together. If we come together again some results can be obtained. I am mystified as to the causes of the breaking up of the old cargo association, but whatever the cause it should not now be insuperable and it behooves us to get together on a broader basis. One portion of the lumber trade cannot be in a healthy condition and secure large prices while another portion remains unsatisfactory.

"In this trade as in all others the cause of higher or lower prices rests in the matter of supply and demand and that is where association work can be made effective. If we should wait until the supply only equals the demand we would wait a long time. Looking over the figures we find that the producing capacity based on a ten hours run has increased to over five billion feet per year, while the whole volume of business, rail, vessel and local, amounts to only three and one half billions. It would seem to be hopeless to wait for the ordinary course of supply and demand to bring about an improvement of prices. It is therefore only through the resource of association work that some method of limiting the production can be reached. That has got to be done.

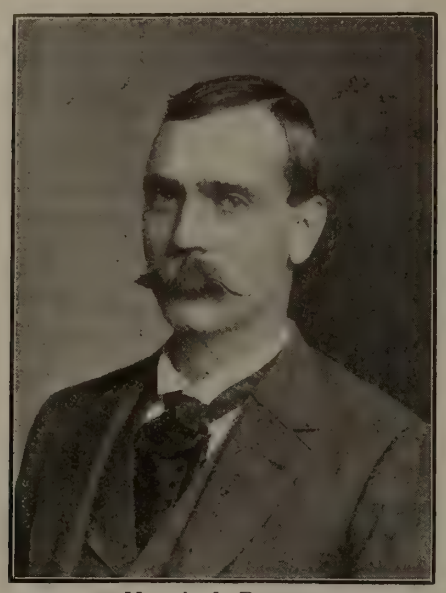
"I recognize that we cannot better the conditions without coming together and taking some concerted action reducing the production. This means a very large sacrifice on the part of some of us. However, I cannot see why people are not willing to make a sacrifice. It would have been infinitely better to have remained in the association and continued our work in harmony than to have gone to pieces as we did. Now some of the mills have the impression that to get a profit they must do a very great amount of business. I do not believe that any mill can by doing a vast volume of business make up a profit or any profit at all. If $3 can be made by concerted action it means that if there is only $1 in it that three times as much business has to be done. This is not to be thought of. We can not have good prices and do a large amount of business at the same time. Now there are more people to do the business and more people doing business than there is a demand for."

PRACTICAL HINTS ON SAWS—HOME PATRIOTISM.

By A. J. Burton.

When my brain becomes languid and ceases to produce the desired line of new thought, I very often get out the old numbers of the trade journals and look them over for new ideas, and while reading over the articles written by others, I get my criticizing machinery in operation on what some other fellow claims to be the only way of doing things, and ten to one I pick up new ideas that had not occurred to me before.

There has been a number of interesting articles in the columns of the trade journals upon the subject of the necessary amount of crown a band saw should have to make it hold its position on the wheels while in the cut. It appears to me that filers differ greatly on this point. I am pleased, however, to see by the



Mr. A. J. Burton,
Manager A. J. Burton Saw Company, Vancouver, B. C.

journals that each year the filers are gradually learning that crown in the back of a single cut band saw is essential to quality and quantity of lumber. Readers of the Canada Lumberman may call to mind an article by the writer five or six years ago, when I strongly advocated that a single cut band saw should have 1/32 inch crown in five feet. At the same time, several brother filers wrote articles attempting to show that a saw would give the same results with a straight back. To-day I find that most of these straight back advocates are now converted to the crown back (they must have added a new wrinkle to their horn). I wish this to be understood as complimentary to these converts for their wise change of opinion, and not the meaning a farmer would understand when buying an old black cow, upon whose horns every wrinkle after six years of age lessens the value of the animal. With a filer, every wrinkle he gets on his horn adds to his value, both to himself and his employer.

Going back to saws and crown, the argument advanced by some saw makers and many filers is that the fact that double cut band saws are straight on both edges is sufficient to demonstrate the necessity of single cut saws to be straight also. This theory does not stand for the following reasons:

A single cut band saw works under entirely different conditions than does a double cut band saw.

First, a single cut saw runs with only one of its edges (the front) off the wheels, and the back always being on the wheels will consequently be tighter on the back than on the teeth. It is necessary, therefore, to crown the back of a single cut to overcome this.

Second, a double cut saw is always wider than the wheels, and both edges run off alike, therefore it is necessary that the saw be straight on both edges in order that it be strained up evenly when on the mill.

I trust that the above will explain this matter to all those interested in this subject.

There is another point on which I wish to speak. It appears to me there is a considerable amount of prejudice among the millmen against the double cut band saw. This should not exist, for the reason that there are a great number in use giving highest results. It is up to the filer to produce good lumber and lots of it. It is a poor excuse for a filer to lay his trouble on this or that make of mill, as there are hundreds of all makes in operation in the United States and Canada.

I believe in buying all we can at home, and to prove my assertion will say I have filed for most every make of band mill made in the United States and Canada, both single and double cut, and I can say with great pride for Canada, and not boastingly, that the mills made by the Wm. Hamilton Company and the Waterous Engine Works Company will cut as much and as good lumber per day as any make of mill "Uncle Sam" ever turned out.

There seems to be a great feeling among millmen of Canada that they must buy their saws, emery wheels and file room supplies in the United States in order to get the best. It is difficult to convince them of the fact that they can buy as good an article at home. I often wonder if it is possible that the people of the United States think they must buy lumber in Canada in order to get the best. If they did it would certainly be a good thing for Canada, and our millmen should not be blamed for encouraging them to continue to think so, and if we look on the subject from an American manufacturer's business point, it is only quite natural that they should continue to impress on our people that their goods are the best, for the reason that they have the goods for sale and we have the market.

How many of our readers realize the fact that many of the best tradesmen in the United States are Canadians and at the head of the largest establishments? Why is it that these men are now looked upon as experts when only a few years ago they were considered to be only ordinary Canadian workmen? It appears to me that the Canadian employers themselves did not realize they had good men and did not give the men a chance to show their ability, consequently their modern ideas are checked and the men go to the Unites States, where they can better themselves and soon develop into experts. This is what becomes of our best tradesmen, and I think if there is any reason why the United States can excel Canada, it is because the American companies have Canadians at the head of their establishments in the capacity of president, manager, foreman or expert tradesmen. I will give a few facts which are well worth consideration.

Out of twenty-five bankers in the city of Chicago, eight are Canadians. Mr. John Hancock, formerly of St. Catharines, Ont., is now at the head of the grinding and polishing departments of one of the largest saw shops in the United States. He learned his trade in Ontario. Mr. A. M. Terry was the head of the tempering department of another large saw company for years. Mr. J. W Walton, of New Brunswick, is the inventor of the wood rim for bicycles and is now at the head of one of the largest cycle works in the United States. Mr. Egan, of Toronto, is now at the head of the great firm of J. A. Fay & Egan, Cincinnati, Ohio, the largest wood-working machinery manufacturers in the United States, and yet these men were not considered to possess more than ordinary intelligence. Therefore I say the best way to improve on the qualities of our manufactures is to secure the best tradesmen and endeavor to keep them, even at an increased wage, as it will decrease the percentage of culls and the cost of production, and increase the prestige and reputation of our manufacturers.

COMBINATION SAWING MACHINE.

The accompanying sketch shows a very handy machine, not sold on the market. It is a combination sawing machine, which can be used for ripping, cross-cutting, gaining, plowing, etc., and for a window frame department H. F. Wachter, writing in the Woodworker, says he has never seen its equal. For the ordinary run of every-day work it is used just as any other rip or cut-off machine. Plows, dado heads, etc., can be used at will, and two men can work on the machine at one and the same time, which in itself is a very great item in its favor. The sketch shows the machine rigged for gaining tank staves or doing other circular work of this character. Fig. 2 shows the top used when tank staves, etc., are being made; it is only necessary to lift this top out of its place and set it to one side, and you are ready for the straight top, which need only be laid in place, and you are ready for straight work.

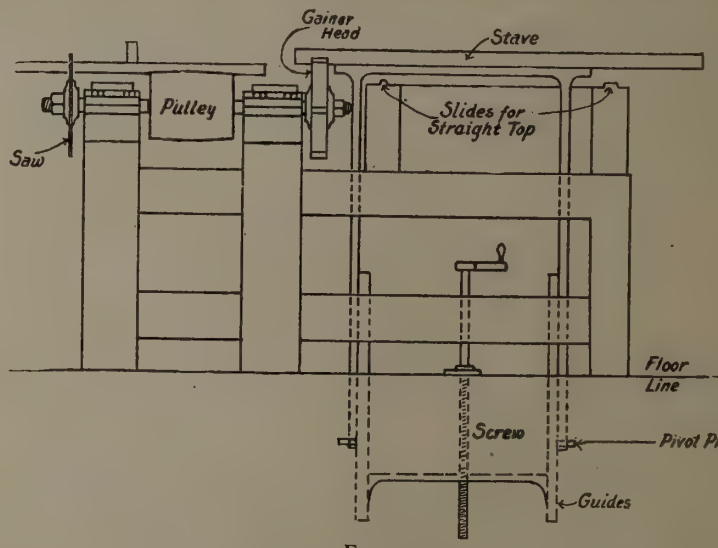


Fig. 1.

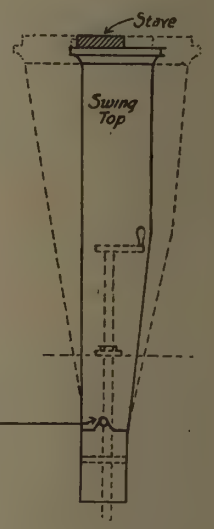

Fig. 2.

The sketches explain the merits of the machine better than the writer can. All that is necessary to say is that it is made of wood in most of its parts, amply large, to balance the material being worked, thus making the work easier for the operator and insuring better results than is possible when the operator has to continually exert himself to balance the stock to keep it in place, which is no easy matter when the stock is heavy, and often requires the help of a boy or man. This is not the case if the top is long, like the one shown. The machine can be made one of the big money-makers of the business, although it is not the best-looking machine in the world.

PERSONAL.

Mr. J. A. Brotherton, of Duluth, has accepted the position of foreman for the Pigeon River Lumber Company, of Port Arthur, Ont.

Mr. Geo. Ball, of Barrie, founder of the Ball Planing Mill, recently visited the World's Fair at St. Louis, returning by way of the Pacific Coast.

Mr. H. F. McLachlin, of the well-known lumber firm of McLaahlin Bros., Arnprior, Ont., recently celebrated the fifty-sixth anniversary of his birthday.

Mr. John S. Fielding, consulting engineer, has removed from 20 King street east, Toronto, to more commodious offices at 15 Toronto street.

Mr. George Gordon, lumber merchant, Cache Bay, Ont., has been chosen by the Conservatives of Nipissing to contest that riding in the Dominion election to take place on the 3rd inst.

Hon. John Charlton, of Lynedoch, Ont., has formally retired from politics, after having represented North Norfolk continuously since 1872 in the House of Commons. As he has been in failing health for some time, his retirement was not unexpected. Mr. Charlton has long been regarded as one of the best authorities on the industrial and commercial condition of Canada. He was a member of the Joint High Commission appointed to consider the trade relations between Canada and the United States, and it is said that he understood the trade question better than any other commissioner. In business as a lumberman he has always been successful.

THE CANADA LUMBERMAN received a pleasant call last month from Mr. J. L. Campbell, President of the Western Retail Lumbermen's Association. Mr. Campbell has been residing for some time in Toronto with the object of getting rid of the effects of a serious illness which laid him aside from business last winter and prevented his attendance at the last convention of the Association of which he is the chief officer. The Association marked its appreciation of his valuable services, however, by unanimously re-electing him to the presidency. Accompanied by his wife, Mr. Campbell proposes to spend the coming winter in Toronto. He has many interesting stories to tell concerning the development of the Canadian Northwest, of which he is one of the pioneers.

The Trois Pistoles Lumber Company are about to build a saw mill at Trois Pistoles, Que., in which vicinity they have acquired 155,000 acres of virgin forest.

MAKES MEN GOOD-NATURED.

An ill-natured man never works well, but **Clark's Pork and Beans** are so good they make all men good-natured. Made by **William Clark, Montreal,** of select Canadian pork and prime Canadian beans. The lumberman's ideal.

BELT ADJUSTMENTS IN THE COOPER SHOP.

Figure 1 represents the incorrect manner in which some belts are prepared for making the union with laces. I have noticed detective joints in belts in cooperage shops of this character. The makers of the belting leather never calculated that the belts would be joined in any way except the straight, parallel alignment. In the making of the belt leather, precautions are taken to overcome stetching of one side of the belt more than the other, by cutting the belt properly from the hide. If the piece were cut from the hide so as to involve portions of the center, the sides, the head and offals, then there would be about as many different degrees of stretching of the belt in different parts, resulting in a wabbly affair that would fail to give effective power. But the belt manufacturers reduce these differences in stretching of the belting to a minimum by selecting the belt stock from such portions of the hide as will assure even stretching, uniform elasticity and evenness in general of the fibre. The belt is finished and sent to the users. In many of the power-consuming instiutions there are power engineers who oversee the work of the belting adjustments and correct imperfect setting. But in the average shop there are only the ordinary workman to care for the belts. A specialist is not employed nor would it be practicable to have one. Therefore in examining the belts one finds various conditions arising in the cooperage shop for imperfect results and ruined belting. The illustration given in the first figure is to show how the belt butts are often united, resulting in drawing the belt line from its true course, and making the belt run from side to side on pulleys. The true line would be "b", taking "a" as the center. The upper end of the belt line inclines to the right on the line "c", leaving a gap in one side of the union which the belt lacing cannot cover. The best way to get the union right is to proceed as in Fig 2. First get the ends of the leather cut right by using a try square for marking off, then cut with sharp knife. See that the butts or leather ends are even, and harmonize one with the other, draw a straight line across each with awl, using square, about 1 inch back from the edge. This makes line "d" for the hole series. To get the holes to correspond, draw cross line "d" from one to the other butt like "e." Now all that is needed is to get a sharp punch, modern belt punch design, and punch the rows of holes. The belt is now ready for uniting.

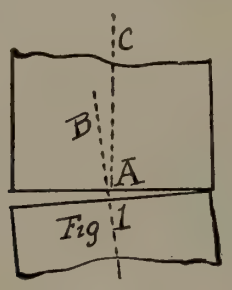

Fig 1

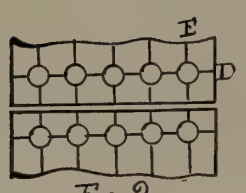

Fig 2

MAKING THE JOINT.

Fig. 3 illustrates a good mode of getting a belt union jointed up for general service. There are, of course, the "hinge" union, the "running" union, etc. But for everyday service, the plain, substantial jointing in this illustration answers all purposes.

You begin the process of lacing at hole "g," and at "h" dropping the lace ends through and drawing tight. Bring up lace "h" at the other end, so as to come through at "i."

Then cross over and go down in the next hole in order, and cross underneath and come up again in the next hole in order, and continue to repeat this operation until the other side of the union is reached, when the course may be gone over again if strength is needed. In some cases it is best to double the operation by using the other lace end at same time and going through the same motions, but in the reverse holes. The final ends of the laces are dropped through and up again once or twice, as at "f" and "j," for purposes of securing the lace ends.

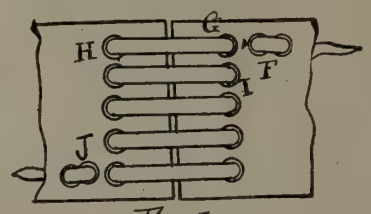

Fig 3

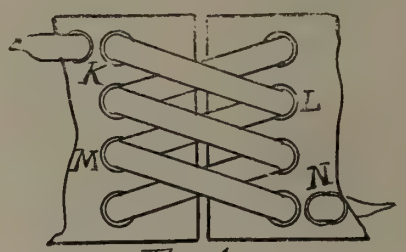

Fig 4

HEAVY LACE.

Fig. 4 represents a heavy form of union sometimes used in the larger sizes of cooperage machinery. This is made with the crosses on the upper side in the sketch, but in the running of the belt the crosses are usually run out from the wheel faces. To make this union start at "k," cross to "l," then to "m," and thence to "n," and so on until all the loops are made, after which the same may be gone through with the other lace end, thus finishing the lacing.

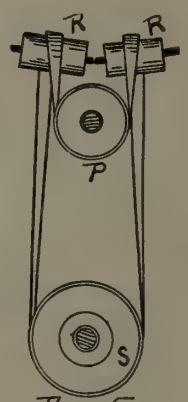

Fig 5

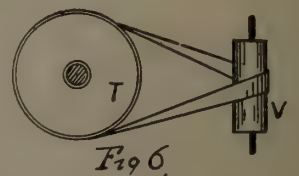

Fig 6

Fig 7

SOME WHEEL ADJUSTMENTS.

One finds quite an array of modern types of machinery in the up-to-date cooperage shop. It sometimes happens that systems of power transmission of a special character are needed, as, for example, as shown in Fig. 5. This consists in the arrangement of wheels not on the same plane being connected. This system is used occasionally in cooperage shops. Two idler or guide wheels are needed in this combination, and these are signified "r," "r," in the drawing. The driving wheel may be either "p" or "s." The system is used for two or three reasons. One is that in case it is necessary to increase the arc of contact of the belt on the upper wheel "p," the idlers can be so arranged as to close the belt over more and nearly envelop the wheel "p." Again, it may occur that there is power needed for transmission on the line of one of the idlers, in which place the idler bearing is substituted for a regular wheel shaft and a pulley is placed thereon.

FOR THE CAMP—

We have a very suitable lot of goods for camp supplies. We make this kind of trade a specialty. You who are not getting suited just as well as you would like, try us for your next order, and give us a chance to demonstrate our ability to give you satisfaction in this very important department of your business.

Wholesale Grocers - - TORONTO

QUARTER TURNS.

The quarter turn systems are frequently resorted to in cooperage and other shops, particularly those shops in which high-speed modern machinery has been installed in recent years. Most of the newest designs of machinery require adjustments of power service for higher speed than the older designs. It happens now and then that the quarter or the half turn is needed to comply with the power systems, and Fig. 6 illustrates the process of setting the same. When a belt is needed to connect two wheels whose respective planes of revolution are at an angle with one another, as in the cut, it is necessary to do some setting. The adjustment should be such that the center line of the length of the belt shall approach the pulley in the exact plane of the revolution of the pulley. The line of motion of the belt in receding from the wheel is not important. It is when advancing on the pulley that the line must be right. In some of the shops recently visited by the writer, cases were found in which the adjustments could not be secured with sufficient accuracy, and to make up for this, a wider pulley "v" was used. Thus the wheel "t" of ordinary width could pay the belt to the cylinder-like wheel "v" at various points, and still the belt would remain on, because of the wide surface. But this is not the mechanical or wormanship way to do the thing. The one wheel should be no wider than the other, nor need it be if the setting is right. Let "t" and "v" represent the wheels of the quarter-turn system. The lower part of wheel "t" turns towards the wheel "v." The center line of the belt is on the plane of rotation of "v," and will of its own accord find the center line, and hold to it so long as the wheels turn in the one direction. If reversed, the line of rotation is altered and the belt will seek a new plane and perhaps run off. The rule is that the advancing line of belt must travel in the line of rotation of the pulley. After finding this line of rotation, and setting the wheels accordingly, no trouble will ensue with regularly made pulleys.

FOR FAST SERVICE ON SHARP TURNS.

In the cooperage shop, as in most manufacturing places, there are always cases in which special turns at high speed are needed in belts. To make the common splice for this quick service on wheels of small diameter would mean that the laces would be bent often, and in a short while would wear off and tear out.

Therefore the type of union exhibited in Fig. 7 has been adopted by many. First you mark off the line for punching the holes. The holes are punched practically the same as in the usual kind of belt joint. But instead of using the two ends of the lace leather and going across the union from hole to hole, the single end of the lace is taken, and entrance is first made at "1." To get a grip on the leather, a double is made here, coming up at "2," with the lace. Then, instead of crossing over the joint, the lace leather is passed through the lips or butts of the belt, coming over to hole "3," going down through the same, to come up at "4." Then down through between the ends of the belt again to "5," and thence to "6," and so on to the end. At "7" the lace begins to make its final grip to hold in position, going to "8," and then out at "9." The one strand, therefore, answers the purpose, and a light, flexible, elastic, hinge-like lacing results that can circuit the wheels of small size with rapidity without straining the union.—National Coopers' Journal.

FIGURING COST.

The matter of figuring cost is one which enters so largely into the problem of successful manufacturing that even the most profitable business can hardly afford to disregard it. Where keen competition draws the dividing line between profit and loss so closely that it is difficult to say on which side a firm will find itself at the end of the fiscal year, it becomes an absolute necessity, says "C.W.L." in The Wood-Worker. Various systems, good, bad and indifferent, have been devised, but so much depends upon circumstances that it is impossible to formulate one which will meet all requirements without making it so cumber-

Department	Pay-Roll	Percentage Increase	Percentage Decrease	Production	Percentage Increase	Percentage Decrease	Labor Cost per Article	Percentage Increase	Percentage Decrease

SAMPLE OUTLINES OF COST BOOK.

some and costly as to defeat the very object which it was intended to attain. The simpler and more direct that it can be made, the better, because less expensive.

As a rule, I have found that cards kept by each man, showing the amount of time expended on each job, are unreliable and take too much time. Very few workmen, especially where they have several changes a day, will keep their time with any degree of accuracy. Where many hands are employed, the work of entering and tabulating the cards is considerable and means an increased force of clerical help. However, I did not start with the intention of criticizing others, but of outlining a simple system which costs little and has proved itself well adapted to our needs.

In the first place, we keep an accurate account of the daly production of each department, which is a simple matter, as our line of goods is fairly uniform in size and grade. The cost book is lined up as appears from the copy. At the end of the week the output of each department is entered and compared with the previous week, as shown. After the pay-roll is made up, that is also entered, and dividing the pay-roll by production gives the average cost per piece absolutely. The total pay-roll, divided by the output of the factory, of course, is the average labor cost of the finished goods. Materials are figured separately. At the end of six months the footings are compiled, and the average labor cost of each article appears as a fair basis of comparison for future use.

Of course, there is more or less fluctuation from week to week, but any department showing a marked or continual increase in cost is due for an overhauling. While it is evident that this method of cost keeping would not be adapted to all kinds of manufacturing business, yet its simplicity, accuracy and inexpensiveness commend it to us as the most feasible and practical plan we have ever tried.

THE NEWS

ONTARIO.

—The Ball planing mill, Barrie, Ont., is being wired throughout for electric lights.

—The dissolution is announced of the Orillia Export Lumber Company, Orillia, Ont.

—There is said to be a splendid opening at Tilbury, Ont., for a planing mill and lumber yard.

—The E. Long Company, of Orillia, Ont., have just completed and occupied their new office building.

—The plant of the Canadian Skewer Company at Hespeler, Ont., is being overhauled and will again be put in operation.

—Church & Bro., of New York, have decided to defer for the present the building of a heading mill at Sand Point, Ont.

—Gardner Bros. have removed their basket factory from Walkerville, Ont., to a site in New Ontario where timber is more plentiful.

—Mickle, Dyment & Company, who installed a double cut band in their Severn mill, report that it has given good satisfaction.

—The Kearney Timber and Manufacturing Company, Kearney, Ont., are advertising for employees to work in their woodworking factory at that place.

—A Board of Trade has been organized at Rainy River, Ont., J. A. Mathieu, manager of the Rainy River Lumber Company, being the first president.

—It is stated that an American syndicate are anxious to locate a match factory at Rat Portage, Ont., if sufficient encouragement is given by the municipality.

—R. F. Houston & Son, Tweed, Ont., have recently purchased 400 acres of timber land. The timber consists principally of elm, ash, basswood and hemlock.

—John Harrison & Sons, of Owen Sound, Ont., are thinking of replacing their circular saw with a band saw in the near future. They report good times in the lumber business.

—Keenan Bros., of Owen Sound, Ont., are changing their recently acquired basket factory into a pail, tub and basket manufactory. They expect to complete the change in about one month.

—The firm of Ross & Taylor, who have carried on business for some years at Exeter, Ont., as lumber dealers and planing mill operators, have applied for a charter for a joint stock company.

—The M. F. Beach Company are making extensive improvements to their wood-working factory at Winchester, Ont. A new fire-proof boiler and engine room is being built which will greatly lessen the danger from fire.

—Alex. Mustard had a saw mill at Bayfield, Ont., which was destroyed by fire a few weeks ago. He applied to the municipality for a loan of $1,500 to assist him in rebuilding, but the by-law for that purpose was defeated.

—Robert Leslie, of the firm of Young & Leslie Bros., Wiarton, Ont., recently had two ribs fractured by the breaking of a piece of lumber he was passing through the ripping machine. He will be laid up for about three weeks.

—Two men were killed by the explosion of a boiler in the saw mill of A. A. Davidson on the 6th Concession of Beverley, near Galt, Ont. The mill was completely wrecked and the large dome of the boiler, weighing 450 pounds, was thrown 375 feet.

—The William Laking Company closed down their mill at Haliburton, Ont., a few weeks ago, after a short season. They expect to get an early start next year and have put camps into the woods for the purpose of getting out an ample stock of logs.

The Owen Sound Sun states that the Carney Lumber Company have decided to locate their saw mill in that town, and that estimates are now being taken for the installation of the plant. It is stated that it will be a two band-mill with an annual capacity of 20,000,000 feet.

—For the past two years Wood Bros. have operated a portable saw mill in the vicinity of Portage Lake, Ont. They are now removing to McLaren's Lake, in the township of Foley, where they have secured a contract to saw for the William Beatty Estate, of Parry Sound.

—The inventory of the estate of the late Edmund Hall, who conducted a large saw mill at Sarnia, Ont., places the total value of the estate at $1,374,192.26. This includes real estate in Canada valued at $151,750, and personal property in Canada, consisting mainly of lumber and mills at Sarnia and Spanish River, valued at $849,965.88.

—The machinery firm of G. S. Sinclair & Sons, Wiarton, Ont., has been turned into a joint stock company, with a capital of $40,000. Mr. Sinclair is president of the new company, whose specialty is the Sinclair patent coupling. They contemplate building a larger shop and installing special machinery for the manufacture of this coupling.

—A sad accident occurred at the saw and planing mill of J. S. Findlay, at Owen Sound, Ont., on October 15th, by which Garfield Maley, of Toronto Junction, lost his life. Deceased was working on the moulding machine when a pulley burst, a piece striking him in the face, splitting his head open. He died within two hours of the accident.

—The Barclay Hodgkins Lumber Company, Limited, has been incorporated at Toronto, with a capital of $50,000, the directors including C. A. Barclay, lumberman, of the Township of Pickering, and Oscar Hodgkins and Howard Hodgkins, of the village of Wellandsport, Ont. The object of the company is to manufacture and deal in lumber.

—The saw mill and lumber business at Brockville, Ont., owned by Van R. Marshall, and now operated under lease by the Rathbun Company, will hereafter be carried on by the Brockville Lumber Company, Limited, recently organized for that purpose. The share capital of the company is $75,000, and the directors include V. R. Marshall and S. A. Geash, lumber dealers, of Brockville, and E. W. Rathbun, of Deseronto.

—The Hurndall Novelty Furniture Company, Limited, has been incorporated at Toronto, to manufacture and deal in lumber, woodenware, etc. C. W. Kerr, barrister, and James Miln, printer, are members of the company.

—A deputation of Western Ontario lumbermen, including George Chew and D. L. White, jr., of Midland, and C. Beck, of Penetanguishene, recently waited on the Premier and Minister of Customs at Ottawa and asked for an import duty on lumber coming into Canada from the United States. Their request was taken into consideration.

—George Gordon, lumber merchant, of Sturgeon Falls, R. W. Gordon and Robert Booth, lumber merchants, of Pembroke, have, in association with others, organized the A. J. Young Company, Limited, to conduct business as wholesale and retail dealers in hardware, lumbermen's supplies, groceries, etc., at North Bay, Ont.

THE EASTERN PROVINCES.

—Gilroy & Hunter, lumber dealers, Springhill, N.S., have dissolved partnership.

—The Sherbrooke Lumber Company, of Sherbrooke, N.S., are building a saw mill at Barachois, N.B.

—Zulima Hamel has registered as proprietress of the lumber business of J. Nadeau & Company, Quebec.

—A. & R. Loggie are said to be considering the purchase of the Bentley saw mill at Loggieville, N.B.

—The saw mill of Lecasse & Boursier at Hemmingford, Que., was slightly damaged by fire on October 8th.

—It is understood that the Boston Last Company are establishing a large hardwood lumber business in the vicinity of Melbourne, Que.

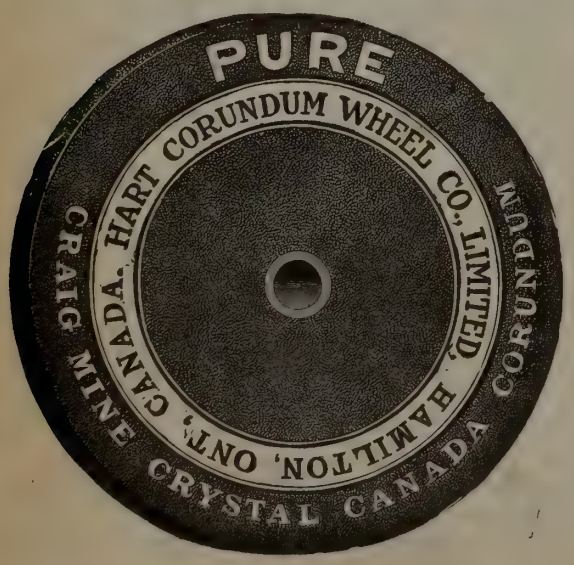
—William Tingley, of Albert, N.B., met death by drowning while working on the boom of the Calhoun Lumber Company at Dalhousie.

—Eliser J. Richard, sash and door manufacturer, has rebuilt his factory at Meteghan River, N.S., which was recently destroyed by fire.

—The Lachute Shuttle Company, Limited, Lachute Mills, Que., has been incorporated, to carry on a general lumbering business. The capital is $50,000, and the incorporators are the Ayers family.

—In the October number it was stated that the Gaspereaux Company, of Halifax, N. S., owned 4,500 acres of first-class timber land. This is misleading, as the holdings of the company are 45,000 acres, consisting chiefly of spruce. The company promise to be a very important factor in the lumber production of Nova Scotia.

CRAIG MINE CRYSTAL CORUNDUM WHEELS



Our Pure Crystal Corundum Saw Gummers have no equal for their rapid, cool, cutting properties.

Read the following from Bulletin 180 of the United States Geological Survey, which says:

"Often a distinction is made between emery and corundum, many persons not recognizing emery as a variety of corundum.

Emery is a mechanical admixture of corundum and magnetite or hematite. It is, of course, the presence of corundum in the emery that gives to it its abrasive qualities and makes it of commercial value, and the abrasive efficiency of emeries varies according to the percentage of corundum they contain."

Emery is imported, mined by Greeks and Turks and contains only about 25% corundum. Our Crystal Corundum is guaranteed to be 98% pure alumina, a Canadian product, mined and manufactured by Canadians for Canadians.

HART CORUNDUM WHEEL COMPANY, Limited, Hamilton, Ont, Can.

—The Baker Brook Manufacturing Company, organized by Donald Fraser & Son, of Fredericton, N.B., have leased a water power site on Baker Brook, where it is proposed to establish a large saw mill to saw logs which would otherwise be manufactured on the American side.

—The Haskell Lumber Company has been incorporated by the Dominion Government, with a capital stock of $400,000. The chief place of business will be at Monte Bello, Que. The incorporators are: W. L. Haskell, of Ulysses, Pa.; Matthew S. Haskell, of Herring, Pa.; Charles Adsit, of Hornesville, N.Y.; George H. Cobb and D. E. Hawkins, of Syracuse, N.Y.; James N. Peck, of Philadelphia, and George W. Thayer, of Rochester.

—The past season has been unfavourable for driving operations on the St. John river, in New Brunswick, and it is said that the contractor, John Morrison, will make very little profit. He has been more than five months at the work and has been obliged to keep expensive crews in readiness when logs were not running. This is Mr. Morrison's fourth year and terminates the present contract. In winding up this season's operations Mr. Morrison is taking up the chains of all of his sheer booms, and this is taken to mean that he does not intend to again figure on corporation driving when tenders are called for in the ordinary course this Fall.

The Trois Pistoles Pulp & Lumber Company, which has been operating for some time at Trois Pistoles, about 150 miles down the St. Lawrence River from Quebec, is announced to have been acquired by New York State capitalists, including Charles R. Walker, of Dekalb; Walter F. Wilson, of Louisville; Royal Newton, of Parishville; Bert Snell, of Potsdam; James Spears, Reuben T. Wells and John Bird, of Canton, and Michael H. Flaherty, of Massena. They have secured control of upwards of 80,000 acres of timber lands covered with pine, spruce, cedar and hemlock. There is on the property a saw mill with a capacity of 8,000,000 feet of lumber annually and 150,000 shingles daily. Another mill was on the property but was partially burned last year. This the company propose to rebuild, giving them a total annual capacity of nearly 20,000,000 feet of lumber.

MANITOBA AND THE TERRITORIES.

—Mr. Miller has started a lumber yard at McAulay, N.W.T.

—George B. Gordon has built a new lumber shed at Gilbert Plains, Man.

—A. W. Reimer has established a retail lumber business at Giroux, Man.

—The Gibson Lumber Company are establishing a branch at Qu'Appelle, N.W.T.

—The Northern Fuel Company have bought out C. H. Bush & Son, lumber and coal, Edmonton, N.W.T.

—Hugh Blackburn has purchased a portable saw mill and is operating it in the vicinity of Gilbert Plains, Man.

—Walters' saw mill at Strathcona, N.W.T., shut down for the season on September 15th, after cutting 10,000,000 feet of lumber.

—The Rat Portage Lumber Company have decided to rebuild their sash and door factory, which was burned recently, in Winnipeg instead of in Rat Portage. This decision has been brought about by the more reasonable freight rates obtainable from Winnipeg to outlying points.

—The Royal Lumber & Fuel Company, Limited, has been formed in Winnipeg, to conduct a wholesale and retail lumber business. I. E. Gaudin has been appointed manager, and with him are associated R. E. Blakeway, contractor, of Winnipeg, J. S. Lougheed, of Deloraine, Man., and others. They will locate retail yards at various points in Manitoba.

—The Great Northern Lumber Company, Limited, is the title of a corporation which will engage in the lumber business in Canada on a large scale. H. J. Haskamp, of St. Cloud, Minn., is president of the company, and H. A. Caulasne, of Northwood, is secretary. The company is capitalized at $100,000. It is supposed to be the intention of the company to establish retail lumber yards throughout the Canadian North-West along the line of the Canadian Northern Railway.

BRITISH COLUMBIA.

—A new brick and stone boiler house is being built by the Royal City Mills, New Westminster, B.C.

—The Kamloops Lumber Company, Kamloops, B.C., are installing an electric light plant with the intention of operating their mill day and night.

—The Britannia Copper Company, of Howe Sound, B.C., are using a large quantity of lumber in the construction of their plant. Over a million feet is being supplied by Robertson & Hackett, of Vancouver.

—The Union Lumber Company, Limited, has been incorporated by the British Columbia Government, with a capital of $100,000. It is proposed to carry on the business of lumber manufacturers and shippers, with headquarters at Vancouver.

—The Canadian Timber and Sawmills Company, of Trout Lake, B.C., of whose property the sheriff has been in possession at the instance of E. L. Kinman, is being reorganized and its troubles straightened out. A local directorate is being appointed. The head office will be at Revelstoke.

—The British Columbia Government have granted a charter of incorporation to the Britannia Lumber Company, Limited, with a capital of $5,000. Alfred Mattinson, of Howe Sound, B.C., is one of the promoters. The intention is to carry on business as timber merchants and saw and shingle mill operators.

—The Capilano Lumber Company have announced that they will immediately rebuild their saw mill which was recently destroyed by fire. It will be located seven miles from the mouth of the Capilano river, near Vancouver, B.C., and will be modern in every respect. The company will also construct a flume to carry the logs from the limits to the mill. They own all the timber on both sides of the Capilano river for six miles back of the waterworks dam, and it includes some of the finest cedar on the coast.

—H. J. Gilbert, president and manager of the Saginaw Manufacturing Company, Saginaw, Mich., visited British Columbia last month for the purpose of arranging for a supply of timber. To a local reporter he stated that his company used from 10,000,000 to 12,000,000 feet of timber annually for the manufacture of woodenware, and he believed that the spruce of British Columbia would be very suitable for the purpose. His company have lately experienced great difficulty in obtaining a supply of timber.

—Considerable interest is being manifested by local millmen in the new roller bearing which has been perfected by John Kincaid, of Vancouver, B.C., and which is being handled by the International Roller Bearing Company, a close concern just incorporated. Mr. Kincaid has been improving his invention for two years and he now has it as perfect as mechanical skill and practical experiments can make it. What makes it of advantage to mills is that 40 per cent. of power is saved, and the device is adapted especially to heavy machinery. The whole secret is in the double cone, and it is contended that this will revolutionize machinery as much as the discovery of ball bearings did. Negotiations are now going on with eastern capitalists, who are anxious to obtain control of the manufacture of the invention.

—John Hanbury, manager of the Hanbury Manufacturing Company, Brandon, Man., and the North Star Lumber Company, Cranbrook, B.C., has purchased land at Elko, B.C., on which he proposes to build an up-to-date planing mill, with a large dry kiln and other modern accessories, by means of which he believes he can improve the position of the local lumbermen and at the same time build up a good business for himself. His plan is to work on a co-operative basis, handling the product of the smaller mills in the rough. This will be shipped direct from the saw to Mr. Hanbury's plant at Elko, where it will be properly seasoned and put in condition to be shipped at the lowest cost for freight. The plan should be favorably received by small mill owners who have no facilities for drying and dressing their lumber.

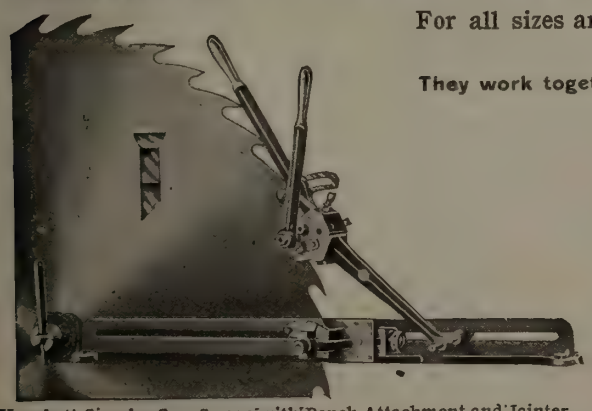
Mr. J. F. Birchard, travelling representative for J.T. Wing, manufacturer of babbitt metal, Windsor, Ont., has just recovered from a serious attack of typhoid fever. Mr. Birchard was on the Pacific Coast on a business trip when he was taken ill and confined to the hospital at San Francisco, California, for about two months. We are glad to know that he is now sufficiently restored to health to be on the road again.

—Canada leads all other countries in the extent of her forests. She possesses 799,230,720 acres of forest-covered land. Russia is credited with 498,240,000 acres, about 48,000,000 more than the United States. India comes next with 140,000,000 acres. Germany has 34,347,000 acres, France 23,466,450, and the British Islands about 2,695,000. This computation does not include Africa or South America, both of which contain immense forests.

HANCHETT SAW SWAGE AND SWAGE SHAPERS

For all sizes and kinds of Saws, Circulars, Bands, Band Resaw, and Gang Saw.

They work together. They give the saw teeth proper clearance.



Hanchett Circular Saw Swage with Bench Attachment and Jointer.

After the saw has been swaged remove the saw swage from the pin and place the Shaper thereon.

The adjustment is made from the point of the tooth, hence every tooth is made exactly alike—widest at extreme points, widest on face, no matter what the irregularity of spacing, pitch, etc. We are always glad to send our machines out on approval guaranteed to please, if not satisfactory return at our expense. A trial will cost you nothing.

Write for circular "F" to

Hanchett Swage Works, Big Rapids, Mich., U.S.A.

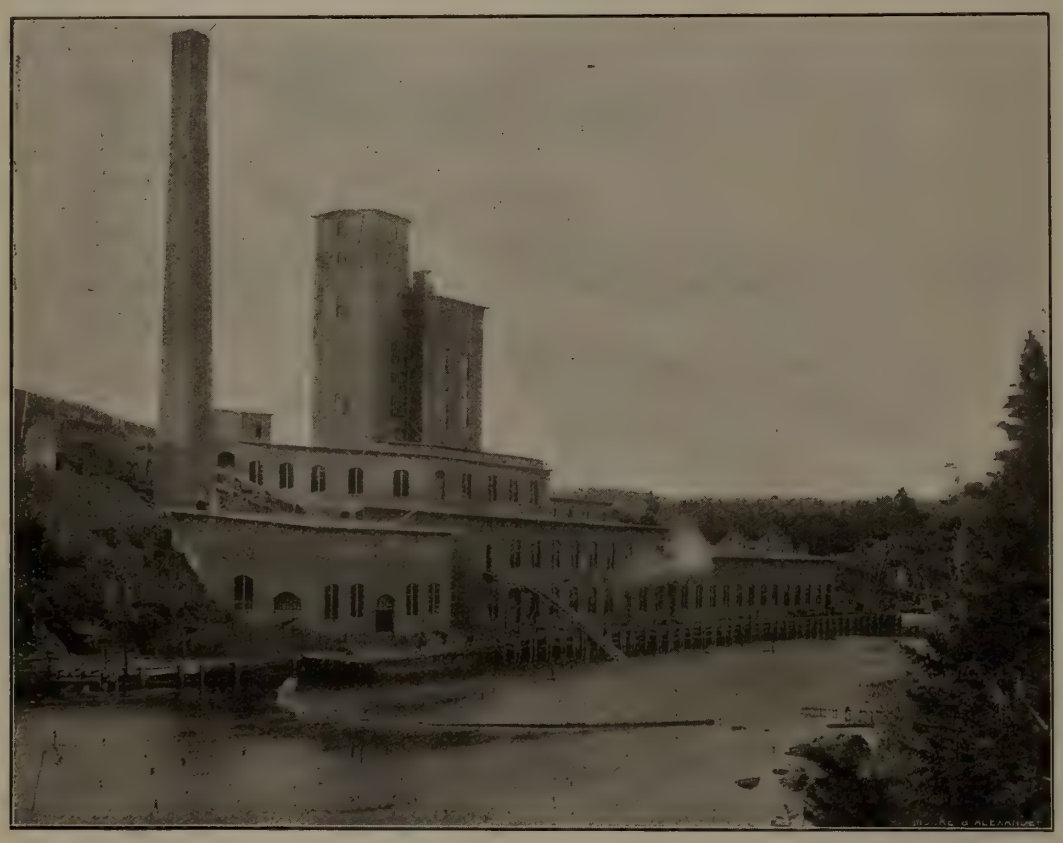
Hanchett Swages do Good Work.

Hanchett Circular Swage Shaper with Bench Attachment.

WOOD PULP DEPARTMENT

SALE OF THE MISPEC PULP MILL.

The liquidators of the St. John Sulphite Pulp Company have disposed of the pulp mill at Mispec, N.B., to the City of St. John. It is said that no other tender was submitted, and it is singular that the amount of the tender has not been made public. It is reported that English interests sent a formal protest against the sale unless the property realized $150,000, and the general opinion is that the price received is below that figure. The City Council have not yet definitely decided what disposition will be made of the mill, but it is likely that it will be offered for sale or lease in the near future.



THE MISPEC PULP MILL, PURCHASED BY THE CITY OF ST. JOHN, N. B.

The mill property consists of 300 acres, located on the Mispec river about six miles from St. John. The buildings are brick and are situated on the bank of the Mispec river. The mill is capable of producing 200 tons of pulp per week, but the building is so arranged as to permit of doubling the output.

The mill dam is substantial and is fifty feet high. There is an ample supply of power for driving the machinery, this being furnished by four water wheels capable of developing 600 horse power. In addition there is a 250 horse power compound steam engine as an auxiliary, and in the boiler room there are steam boilers of 500 horse power capacity for use in the cooking and drying of the pulp.

The promoter of the mill was Mr. M. F. Mooney, who floated the enterprise in Scotland and was subsequently appointed manager.

THE OUTLOOK FOR PULP AND PAPER.

Mechanical wood is not in abundant supply. It is not plentiful, and those who own it are somewhat independent in their views. They favor the policy of waiting for a rise rather than that of making a quick sale. Late news from the Scandinavian market shows that there is practically no free ground wood there, and that manufacturers there are not at all sure that they can deliver all the goods already contracted for, not because the contracts are unusually large but because by reason of drought production has been and is greatly restricted, and there are no signs of a renewal of the water supply. A shortage in the Scandinavian supply will naturally increase the demands on other ground wood producing countries, and as we are buyers of ground wood we, of course, are more than likely to feel the effects of these conditions.

Sulphite does not show any weakening tendency and standard and well known makes are bringing full prices. The soda fibre manufacturers advanced prices 2½ points, and they agree that conditions would warrant a considerably larger advance. Supplies are low, and it is stated that the present stock would be sufficient for only three to five days' demand. That a greater advance is not made is only due to that forbearance for which soda fibre manufacturers are so noted.

The price of wood is steadily advancing and the price of labor is constantly moving in the same direction. These factors support the value of pulp, and they in turn support the prices of papers in which they are an important factor, such as book, news, manila, wrapping, tissue, &c. It is generally conceded that lower prices are entirely out of the question. If they remain on their present value, buyers will be getting all to which they are justly entitled, while with high wood, high labor, short supplies, and a largely increased late demand for paper, producers of the latter expect to see higher quotations in force. — Paper Trade Journal.

PULP NOTES.

The output of the Riordan sulphite pulp mill at Hawkesbury, Ont., is now maintained at very nearly the full present capacity of 100 tons per day.

It is stated that the pulp mill of the Maritime Sulphite Fibre Pulp Company at Chatham, N. B., will be put in operation by the Bank of Montreal, who now control the property.

The Bostwick timber limits in New Brunswick, which were recently purchased by W. H. Parsons, will provide a supply of pulp wood for the Pejepscot Paper Company, in which the purchaser is interested.

It is reported that the pulp mills of Sault St. Marie, Ont., will be operated to their full capacity next year, as it has been decided to take out 50,000 cords of pulp wood during the approaching winter. The mill will be operated by the reorganized Lake Superior Consolidated Company.

At a meeting of the Scandinavian Chemical Wood Pulp Association, held in Christiania lately, it was stated that this year's and most of next year's production was already sold. It was not deemed advisable to fix higher prices for next year, and the following quotations, c.i.f. London, were submitted: Ordinary Strong pulp, £8 5s.; best grades of easy bleaching pulps, £9.

The United States manufacturers of soda pulp have fixed the price for 1905 at 2.15 cents for both contract and non-contract business. This year's figures are 2⅛ cents for contract and 2¼ cents for separate orders. The advance made, therefore, is but 50 cents per ton, which is less than is believed to be warranted by conditions. Reports collected disclose the fact that stocks at the mills are very light.

According to information received from the different wood pulp districts, the prospect of a water famine in Sweden is not so pronounced as in Norway. Although the summer there has been very dry, the snow-melting during the Springtime proceeded so quickly that the lakes and reservoirs were well filled in the early part of the summer. This month, however, will decide how the mills are going to be worked during the winter.

The Lockwood Trade Journal Company, 150 Nassau street, New York, have issued the 30th annual edition of Lockwood's Directory of the paper, stationery and allied trades. This edition is a record breaker in every respect, being larger and more comprehensive than any previous number. It includes a complete list of all the paper, pulp and chemical fibre mills in the United States, Canada, and Mexico, as well as a list of paper dealers and importers, stationers, manufacturers of blank books, envelopes, paper bags, boxes, etc. All departments have been revised and brought strictly up-to-date, and the vast amount of information it contains makes the book very valuable and useful. The retail price, express prepaid, is $3.

The Manitou Lumber Company are enlarging and improving the planing mill which they recently purchased at North Bay, Ont.

WATER POWER
Paper, Pulp and Sulphite Fibre Mills

THE ST. CROIX LUMBER COMPANY.

Among the latest additions to the lumber industry of Nova Scotia is that of the St. Croix Lumber Company, of Hartville, N.S. The company was incorporated under the laws of Nova Scotia in December, 1903, operations being immediately commenced by the purchase of the mills and limits of T. G. McMullen at Hartville, N.S. The limits comprise 30,000 acres of first-class timber lands, heavily clothed with spruce, pine, hemlock and birch. The management consists of the well-known David McPherson, M.P.P., of Nova Scotia, president; J. C. McIntosh, vice-president; and J. M. Davidson, secretary-treasurer and manager, with office in Halifax, N.S.

The plant, which comprises a saw mill and lath mill, is equipped with the most modern machinery, including log haul-ups, trimmers, band saw, edger, planing machine, resaw, slab saws and lath machinery. Power for driving the machinery is obtained from a turbine water wheel of 150 horse power. Piling grounds afford room for the piling of from two to three million feet of lumber, the company having at the time of writing 2,000,000 feet awaiting shipment via the D.A.R. to Halifax, thirty-seven miles away.

Most of the stock, which figures out at four and one-half million feet annually, is marketed in Great Britain, about twenty per cent. going to the United States and fifteen per cent. locally. The lumber is manufactured in the proportion of 65 per cent. spruce, 10 per cent. pine, 20 per cent. hemlock and the remaining 5 per cent. hardwoods, chiefly birch. The percentage going to Great Britain is sold at the mill to W. Malcolm McKay, of St. John, who ships via Halifax, where he has an office, while the company deal directly with American purchasers for the New York market.

Not content with the property as purchased, the management, desirous of producing first-class lumber, have improved their equipment by shortening the carriage and adding an extra saw to the edger. They purpose increasing the capacity by installing a new edger next spring, while, providing the market for their lumber improves, it is their intention to extend operations by the purchase of other properties known to be on the market. Despite the present slump in the price of lumber the company are well satisfied with the result of their first year's working, as they had the good fortune to dispose of 2,500,000 feet of lumber before the slump in prices came on.

Mr. David McPherson, the president of the company, was born in Shelburne County, N.S., in 1834, of Scotch parents. On attaining the age of manhood he came to Halifax and began work as a shipbuilder there, soon building up a large trade in the construction of wooden ships, which he owns and runs to this day. At the age of thirty-five he began to take a large interest in public affairs and it was not long before he succeeded in being elected to the city council of Halifax. Since then he has twice been elected as mayor of the city, between the years 1892-1898. In 1898 he entered the Provincial House and soon distinguished himself, being appointed as a member of the cabinet of Nova Scotia in 1900.

Mr. J. C. McIntosh, the vice-president, is a much respected private banker and broker of Halifax.

Mr. J. M. Davidson, the secretary-treasurer and manager, is a member of the bar and a graduate of Dalhousie College, where he took the degrees of B.A. and L.L.B.

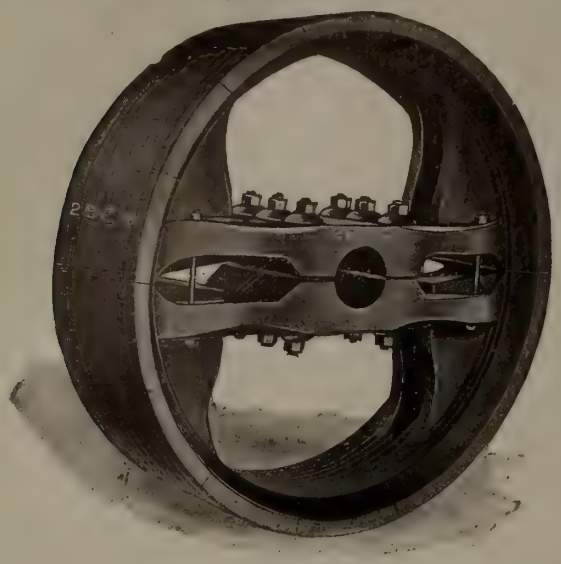
THE FAIRBANKS WOOD SPLIT PULLEY.

The accompanying cut represents the Fairbanks wood split pulley now being manufactured in Montreal and sold by The Fairbanks Company in their Montreal, Toronto, Winnipeg and Vancouver offices. This



pulley has been manufactured for some time in the United States, and was selected by The Fairbanks Company as the best wood split pulley made.

The following is a description of same: The arms of the Fairbanks wood pulley are made of hard maple, well seasoned and thoroughly kiln-dried; they are clamped together and bored, thereby making a perfect round hole so as to fit the shaft. The hub is then cut so as to allow compression to be obtained, and the friction surface on the shaft is nearly equal in length to the width of the face of the pulley. The outer face of the arms are so cut as to add to the appearance of the pulley. The outer ends of these arms are provided with recesses to receive the webb. These webs are thoroughly glued and nailed to the arm and are built in with the rim, thereby making a strong connection between the arms and the rim.

The rim of the pulley is made of soft wood, thoroughly seasoned and kiln-dried. The segments are built up, on a true inside circle and thoroughly glued and nailed. The entire pulley, so to speak, is built up at the same time, which is claimed to be an advantage over pulleys where the rims and arms are built up separately, and afterwards assembled.

This pulley with its web construction is an advantage over other pulleys owing to the support given to the rim, which not only strengthens the entire pulley but makes it impossible for the rim to work loose at the arm. The pulley is inspected in the course of its construction as to material and workmanship. The pulley is particularly adapted for saw and planing mills. Any further information will be gladly furnished by the Fairbanks Company, who have established several agencies for same throughout Canada.

If you wish to sell or buy a timber limit, saw mill or other lumber property, try an advertisement in the CANADA LUMBERMAN WEEKLY EDITION.

LUMBER FIRES.

That lumbermen and woodworkers were having their share of fires in August was shown by the figures compiled by the Journal of Commerce and Commercial Bulletin. The compilation showed for the United States and Canada an aggregate loss of $971,750, which included thirty losses in excess of $10,000, amounting to $845,000. To this is added 15 per cent. for small and reported losses, bringing the total to the above figure, very nearly approaching a million dollars.

But bad as was the month of August, its losses become small when compared with those of September. In the same territory the total for the first autumn month amounted to $2,256,300, which included forty-one losses of $10,000 or over. This is an increase of 132 per cent. over the previous month, and would appear to indicate that one of those unaccountable fire epidemics which often attack some one branch of business is now running through the lumber trade.

Whatever other result this may have it must teach even greater caution against fire than now exists among owners of lumber yards and woodworking plants. There is a lesson in it, too, for the man who carries no insurance, because he believes his lumber yard immune from the sparks of the passing locomotive, the ashes of a careless laborer's pipe, or the thousand and one other causes of mysterious fires. The loss of two and one quarter millions in thirty days does not fall so heavily on the trade as it might, were it not for the insurance companies, who are as usual bearing the burden of the loss. Their services in this month of disaster have been such that no lumber dealer can in justice to himself afford to do without hem.

TRADE NOTES.

Messrs. Henry Diston & Sons, manufacturers of saws, files, etc., Philadelphia, advise us that it is their intention to establish a factory in Toronto.

The corporate name of the Milner-Petrolia Wagon Company, Limited, Petrolia, Ont., has been changed to the Petrolia Wagon Company, Limited.

The Toronto office of the Fairbanks Company, dealers in wood-working machinery, engineers' supplies, etc., has been removed to 100 King street west.

The Georgian Bay Engineering Works are erecting a large wharf at their plant at Midland, Ont. When completed it will be 3,500 feet long and 1,500 feet wide, with a minimum depth of 20 feet in the slip.

The Gutta Percha & Rubber Manufacturing Company have commenced the erection of their new factory on O'Hara ave., Toronto. The building will be 180x152 feet, four stories high, and will cost about $100,000.

Clarke & Demill, manufacturers of woodworking machinery, Galt, Ont., are likely to remove to Hespeler, the ratepayers of that place having approved of a by-law granting them a loan of $20,000. Not a single vote was registered against the by-law.

The Nipissing Foundry & Machine Company, Limited, has been organized at North Bay, Ont., to carry on a general foundry and machine business. The promoters include George Gordon, lumber merchant, of Sturgeon Falls, and Robert Booth and R. W. Gordon, lumber merchants, of Pembroke. The capital of the company is $20,000.

Chew Bros., of Midland, Ont., recently built a new boiler house and installed a new 50 horse power boiler. Concrete foundations have been put under their engines. They have also installed a new log loader and a Waterous carriage. This firm cut between five and six million feet of lumber this season, most of which has been sold.

The William Kennedy and Sons Company, of Owen Sound, Ont., have recently erected a new office building designed to provide the additional accommodation rendered necessary by the great increase in the volume of their business. As most of our readers know, this company are manufacturers of water wheels and general foundry work.

The Owen Sound Iron Works, Owen Sound, Ont., are putting in a twelve-foot roller and a heavier punch and shears. With the air tools already in use this firm will have one of the most complete mill machinery equipments in their locality. They recently entered the cement machinery manufacturing field, and have already supplied several machines.

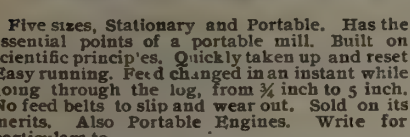
The growth of their business has compelled Hammacher, Schlemmer & Company, dealers in hardware, tools, glue-handling appliances, etc., New York, to secure larger quarters. These have been obtained at Fourth Ave. and Thirteenth street, where the company are now located, and they extend a cordial invitation to their customers and friends to inspect their new home from "cellar to attic".

The business of the Stilwell-Bierce & Smith-Vaile Company, manufacturers of hydraulic machinery, etc., Dayton, Ohio, has been acquired by Colonel J. D. Platt, president of the Barney & Smith Manufacturing Company. Colonel Platt has organized a new company to be called the Platt Iron Works Company, and to have a capital of $400,000. The unfinished contracts of the Stilwell-Bierce & Smith-Vaile Company will be taken over.

Lewis Bros., wholesale hardware dealers, Montreal, are about to erect a large building in that city to accommodate their increasing business. It will be located on Bleury street, near Craig, and will extend to Hermirnie street. It will be six stories high, in addition to a basement, and will cover 20,000 square feet of ground surface. Lewis Bros. are well-known to the lumber trade, being large dealers in axes and other lumbermen's tools.

Mr. Bennett's declaration that a duty on lumber is required to preserve the great trade upon which this district depends largely for its prosperity received a pointed confirmation when a shipment of three inch maple was brought into Orillia from the United States last week, to compete with the home product.—Orillia Packet.

NEW BUCKEYE 1903 IMPROVED SAW MILL



Five sizes, Stationary and Portable. Has the essential points of a portable mill. Built on scientific principles. Quickly taken up and reset Easy running. Feed changed in an instant while going through the log, from ¾ inch to 5 inch. No feed belts to slip and wear out. Sold on its merits. Also Portable Engines. Write for particulars to

ENTERPRISE MFG. COMPANY
COLUMBIANA, OHIO.

THE WILKINSON PLOUGH COMPANY, LIMITED, TORONTO.

AN EVIDENCE OF PROSPERITY.

It follows that, when one makes a specialty of a thing, he becomes more and more skilful in that direction, and constantly works to better advantage, owing to his increasing dexterity. This principal also applies in manufacturing. Where a limited line is built, instead of a general line, special machinery adapted to the most advantageous possible construction of the same can be installed, the various parts can be run through in large lots, which reduces the cost to the minimum, the men become exceedingly proficient in the work, etc.

It is to this fact, and to the fact that they have one of the most severely practical designers in the country, that the Gordon Hollow Blast Grate Company, of Greenville, Michigan, the largest manufacturers of hollow blast grates, edgers and trimmers in the world, attributes its wonderful success.

Having found its former facilities unequal to its constantly increasing business, it is adding to them by the installation of new special and other machinery, including a Corliss engine, and by two additions, one 22x40 feet, two stories high, and one 40x80 feet, also two stories high. Further improvements are also contemplated.

THE DISTINGUISHING MARK

To install in your mill a set of saws that will suit you in every particular, it is necessary that you be familiar with some means of distinguishing the HIGH-CLASS SAWS from the others. Knowing some such mark you will always discriminate in favor of the saw which bears that mark of QUALITY.

THE ATKINS "TRIPLE A" etched on all HIGH GRADE SILVER STEEL CIRCULAR and BAND SAWS, is the sign which assures QUALITY, EXCELLENCY and absolute SUPERIORITY in Saws. "IF IT'S SILVER STEEL IT'S AN ATKINS." Look for our trade mark.

A little reminder of the "TRIPLE A" in the way of a pretty watch charm to Mill men who write for it. Also our Mill Supply Catalogue. Both free.

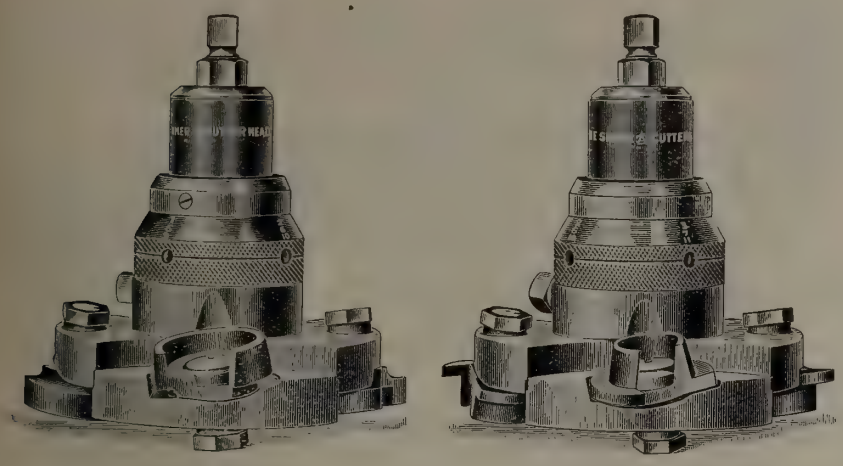
WITH EXPANSION

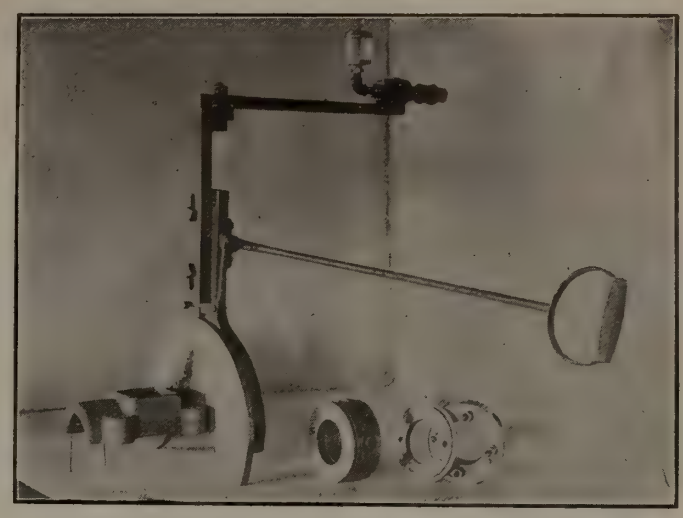


Are built from forgings of Steel and finished throughout in the solid metal. This insures accuracy, durability and perfect mechanical adjustments.

They are appreciated by the user because they hold up under the severest tests. They cut easily all kinds of hard, knotty and cross-grained lumber. If you make single tongue and groove Flooring, Ceiling and Wainscoting, buy THE SHIMER CUTTER HEADS and you will have no disappointment. Address

SAMUEL J. SHIMER & SONS

Milton, Pennsylvania



"KILLAM'S TANDEM CIRCULAR SAW MILL"

The attention of Manufacturers of Lumber is called to the above named latest and best method of sawing lumber.

The following advantages are obtained:

Lower cost of installation than any other method which will saw an equal number of superficial feet in a given length of time.

Smaller expense in operation th is producing lumber at a lower cost per thousand feet than any other method.

Requires no more help to operate it than any well equipped Circular Saw Mill.

Lumber has been sawn better and more accurately cut by this method than by any other now in use.

The Killam Tandem Circular Mill requires no more skilled men to operate it than is required to operate the ordinary Circular Mill.

If solid saws are used, the larger one, when worn down can be used for the smaller one thus saving expense for saws.

No difficulties in handling or setting by this machine and no delays.

No time is lost in setting for any thickness from the cut of stationary saw up to six inches.

This machine takes the place of a resaw in a mill and only requires a floor space of 6 ft. x 6 ft.

Also takes the place of a Twin Circular Mill that is now used for slabbing and this machine will side as much lumber as any Twin Circular, thus sa ing the expense of a resaw and men to operate the same

This machine is so cheap that any manufacturer of lumber can well afford to have one, for it will ppy for itself in a short time.

Will cut 50 per cent. more lumber than the Circular Mills now in use.

MANUFACTURED BY OXFORD FOUNDRY & MACHINE COMPANY, OXFORD, N. S.

REFERENCE.

M. L. KILLAM, TRURO, N. S.

Dear Sir,—It gives us great pleasure to testify to the value of your Tandem Circular Saw Mill It has paid for itself twice over during the six months we have run it. It requires no more help to operate it and the lumber is more evenly sawn. It does all that you claim it will and we would recommend it to any manufacturer who wishes to make more and better lumber with the same help as with the Single Circular Mill. Wishing you success, we are Yours very truly,

Dec. 31, 1903. DICKIE & McGRATH Tusket, N. S.

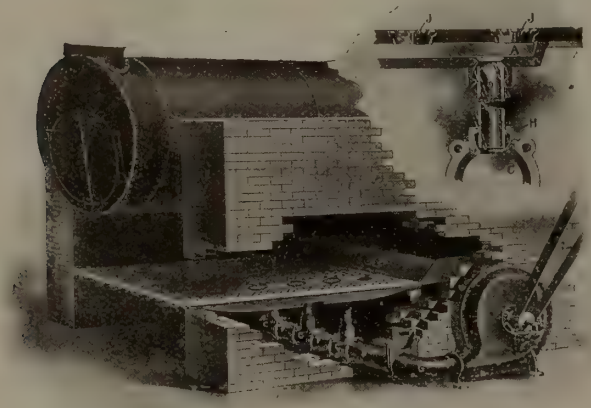
BURN YOUR REFUSE UNDER YOUR BOILERS
SELL YOUR WOOD
Add from 20 to 50 Per Cent. to your Steaming Capacity



There are four good reasons why the Gordon Hollow Blast Grate is a very profitable investment for the purchaser. They are as follows:

1. They enable him to dispose of his refuse without expense, by burning it under his boilers.

2. By permitting him to use refuse as fuel, his power is costing him practically nothing in this direction.

3. It develops every ounce of steam his boilers are capable of generating, frequently adding from 20 to 50% to his steaming capacity.

4. For a mill having five years or more to run, it is absolutely the cheapest grate of any description, blast or draft, on the market, by reason of its great durability.

We pay the freight.

We sell on approval, giving 30 days in which to thoroughly test the apparatus, which is returnable at our expense, if unsatisfactory.

In writing for prices, do not fail to state number of boilers, and give width of furnaces or ovens and length of grates.

MADE IN CANADA
FAIRBANKS WOOD-SPLIT PULLEY
The Best for Saw and Planing Mills

This pulley is not an experiment but has been sold for several years past all over the United States, and the universal satisfaction it gave and the success it met with prompted us to manufacture in Canada.

It has a reputation superior to that of any other Pulley for merit of design, workmanship and finish.

The web construction (see cut), built in the rim, not only strengthens the entire Pulley but makes it impossible for the rim to work loose at the arm.

Each segment is not only glued but nailed with three nails to the next one. Four point bushings are used, giving twice as much grip on the shaft as in the usual two piece bushing.

The merits of any article are best proved by a trial. Send us a trial order the next time you want any pulleys. We carry a large stock and with our factory in Montreal can supply any special pulley in 24 hours if not in stock.

Reliable Veterinary Remedies

No logging outfit is complete without a supply of reliable veterinary remedies. Getting the wrong kind means the loss of the use of your horses when time is valuable.

Johnson's Veterinary Remedies are guaranteed never to fail when used as directed You get your money back if they ever do.

They are

Johnson's Horse Linimint No. 1.
A penetrating Alcoholic Linimint. Put up in one gallon jugs, with full directions, per imperial gal. **$4.50**

Johnson's Horse Linimint No. 2.
A combination of the best oils used as linimints, imp gallon . . **$3.00**

Johnson's Horse Colic Remedy.
A sure and speedy cure for colic Imperial gallon **$5.00**

Johnson's Veterinary Healing Ointment.
Positively the best all-round healing ointment made. In use by the largest owners of horse flesh in Canada. Put up in 2 lb tins, each . . **$2.00**
or in ¼ lb tins, per dozen . . **$3.00**

Johnson's Condition Powders. (Concentrated).
Put up in bulk, per lb . . . . **3c.**

These goods being put up in bulk are more economical than others, as cost of bottling, etc., is saved.

CAMP REMEDIES.

In addition to our Veterinary Remedies we make a line of medicines for lumbermen, including a strong, penetrating linimint, healing ointment, cholera cure, liver pills cough syrup, in fact anything in the form of Camp Drug Supplies. We know that there are no better remedies made than those we offer. There may be others nearly as good, but they lack our guarantee. Satisfaction or money back. A trade discount of 10% allowed off all orders amounting to $100.

Send postal for printed matter.

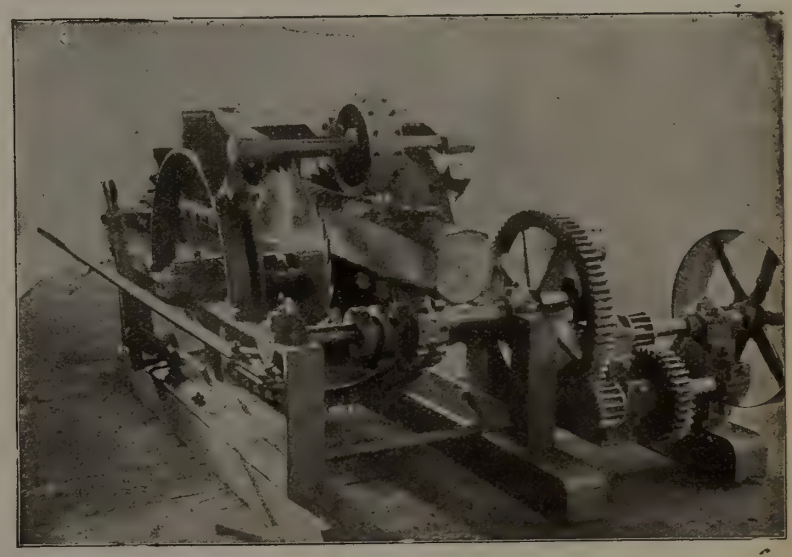
THE BEST IN THE WORLD

There is no doubt about the fact that the

RODGERS
Adjustable Log Siding Machine

is without a peer.

This machine will slab opposite sides of a log in one operation at the rate of two thousand logs in 10 hours.



A MONEY MAKER **A MONEY SAVER**

HUNDREDS OF LETTERS RECEIVED LIKE THIS :

Rock Island, Ill., Nov. 25, 1902.

RODGERS IRON MANUFACTURING CO., Muskegon, Mich.

Gentlemen :—Replying to yours of recent date and referring to your adjustable log siding machine, must say it has given us general satisfaction, and we have done good work with it. Any one desiring a machine of this style for the purpose of slabbing small logs, we would recommend yours. Respectfully, WEYERHAUSER & DENKMAN.

For full particulars and literature, mention this paper and address :

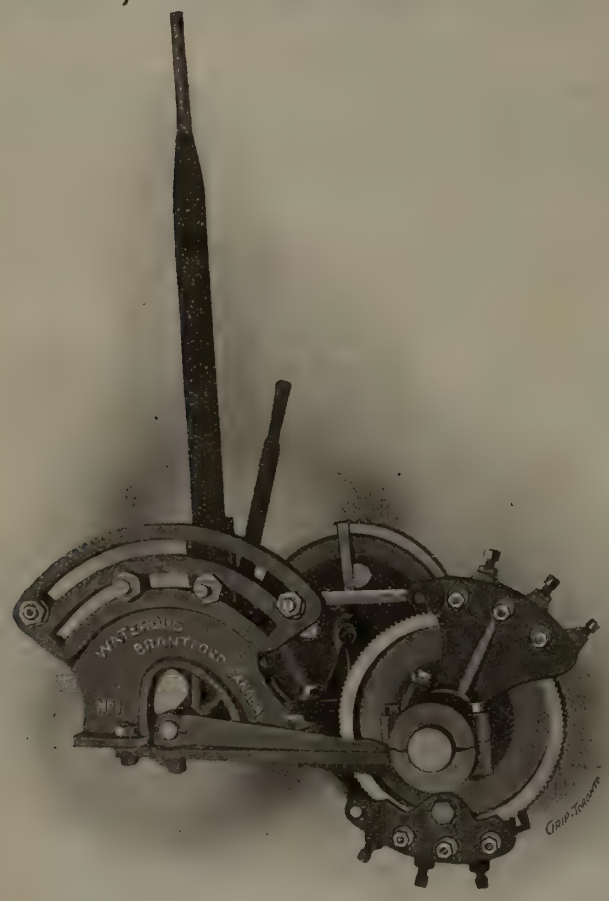
RODGERS IRON MFG. CO.
MUSKEGON, MICH.

The Waterous Cast Steel Carriage

Practically unbreakable. Will stand the hardest Nigger Pounding. Frames of Oak. Upper sides faced with steel. Ends of side timbers fitted with steel plates and strongly supported to cross girts by corner brackets.

FOUR BLOCK CAST STEEL CARRIAGE WITHOUT AUTOMATIC COUPLER.

NOTE OUR NO. 2 SET WORKS, 4 INCH FACE CUT STEEL RATCHET, PAWLS FULL WIDTH OF WHEEL FACE



WATEROUS STEAM SETTER

Will increase cut from five to ten per cent. Acts instantly, never tires. Steam is supplied by telescope pipes, the main pipe fixed under carriage and pipe piston attached to carriage and connected to setter by steam and exhaust pipes.

Very Simple Easily Attached Very Reliable

NEED NEW TRUCKS?

"STANDARD" improved trucks cost little more than the ancient styles of ten years back, and you'll find them worth a good deal more than they cost you. It is an easy matter to demonstrate that they run far more smoothly and are constructed for greater durability than any other trucks made. Ask us to prove it.

The Standard
Channel Steel, Roller Bearing
Dry Kiln Trucks

Have channel steel frames, **malleable** iron wheels and spreaders, steel rollers with **cone-shape** (anti-friction) ends, **lathe-cut** axles with **milled** ends (so you can take the truck apart without injuring the axles), and a number of other exclusive and important features of superiority.

If you want to know all about these good trucks, write for Catalogue "D" and our booklet "TRUCK TRUTHS."

THE STANDARD DRY KILN CO.
Indianapolis, Indiana, U. S. A.

THE TRIUMPH TURBINE

Is the most powerful wheel on the market to-day. A glance at this cut of the centre shows that the buckets are designed to secure the **maximum** of **speed** with **great power** and a **free discharge.** Mr. E. S. Edmondson, of Oshawa, writes as follows under date of November 16th, 1903, regarding a 26 inch Vertical Triumph Wheel:

> "The Wheel is strictly first-class in every particular, and after a careful and thorough test I am prepared to say that I believe it is the best wheel in the market for Electrical purposes. It has high speed, large power, high efficiency at part gate, and has practically no leakage. I am more than pleased with the thorough and workmanlike setting you gave me throughout."

For horizontal settings in large Pulp Mills, Cement Mills or Electric Power Developments this Wheel has no equal. We invite your enquiries. Large catalogue to be had for the asking.

We are always glad to submit estimates and prices on **Improved Vulcan and Leffel Turbines, Improved Lane Circular Saw Mills, Edgers, Trimmers, Slashers, Shingle Machines, Lath Machines** and all machinery of this kind.

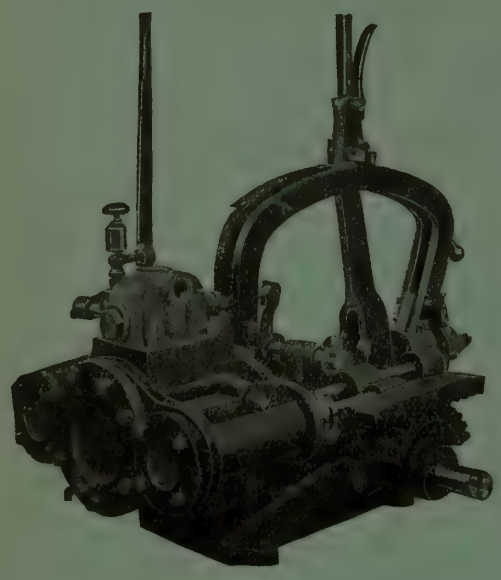
SAW MILL MACHINERY



Saw mill men are fast finding out and appreciating the great saving effected by using Steam Setting Machines.

We have supplied these machines on trial on the understanding that they were to be returned to us if they did not give every result promised.

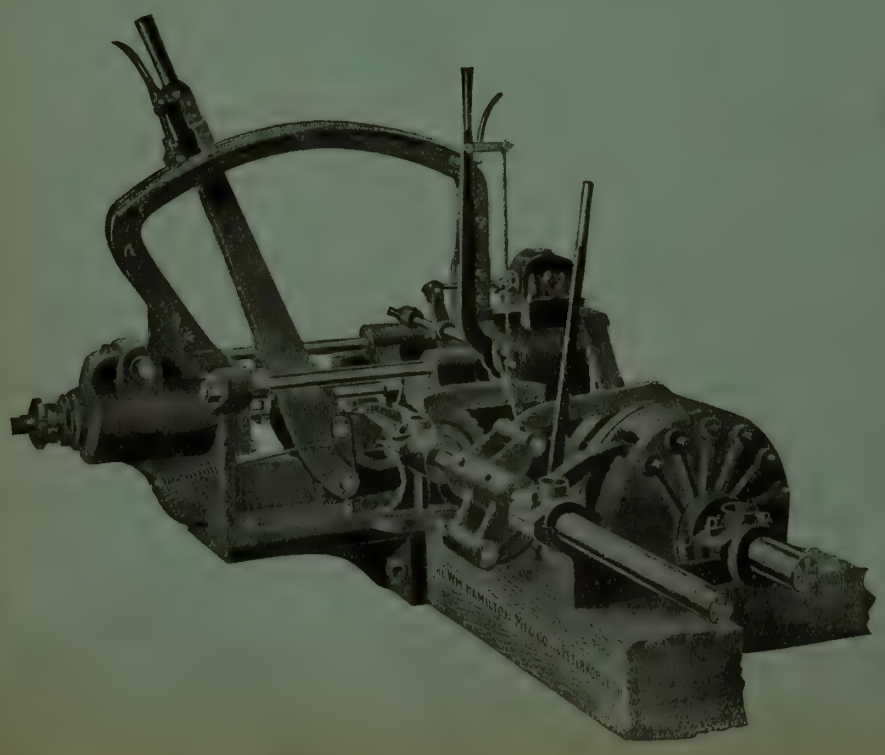
Not one of them has ever been returned.

Ask your setter if he could not do better work with one of these machines, then write us for prices and catalogues.

The standard size machine, as shown in cut, is well known to all mill men. Every one in operation is proving daily that you can cut more and better lumber with it.

When deciding on your improvements for next season you must take this machine into consideration.

This cut shows our Steam Set Works for the large blocks in use on the Pacific Coast. It is a very powerful machine, and will set for two-inch lumber as quickly and more easily than the hand lever now sets for one.



Our last illustration shows our

IMPROVED STEAM SETTER

WITH ENCLOSED RATCHET SET WORKS

This is an improved form of the standard machine. We consider it is the most reliable and efficient form of Steam Set Works that exists at the present time.

It will set four inches with one throw of the lever, and is just the thing for mill men sawing timber for export.

We are anxious to tell you more about any of these machines. Why not send for our catalogue ?

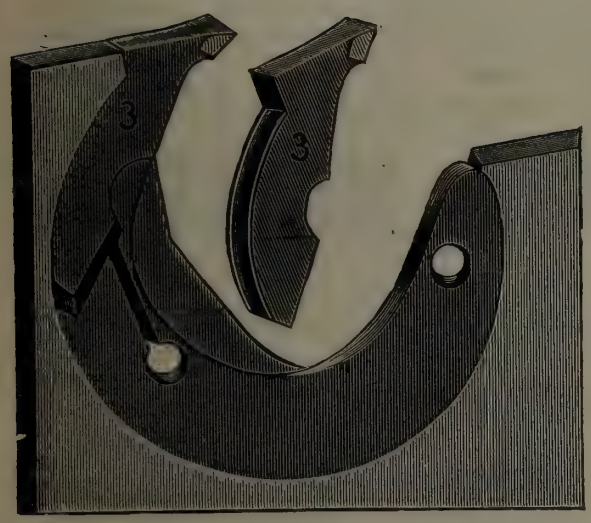
St. Catharines, Ont.

We are the Sole Manufacturers of Saws under the **Simond's Process** in the Dominion of Canada.

There is no process its equal for tempering circular saws. Other makers recognize this fact, as some of them, in order to sell their goods, claim to have the same process. **All such Claims are FALSE,** as the patentee in the U. S. and ourselves are the only firms in the world who use it.



INSERTED TOOTH SAWS

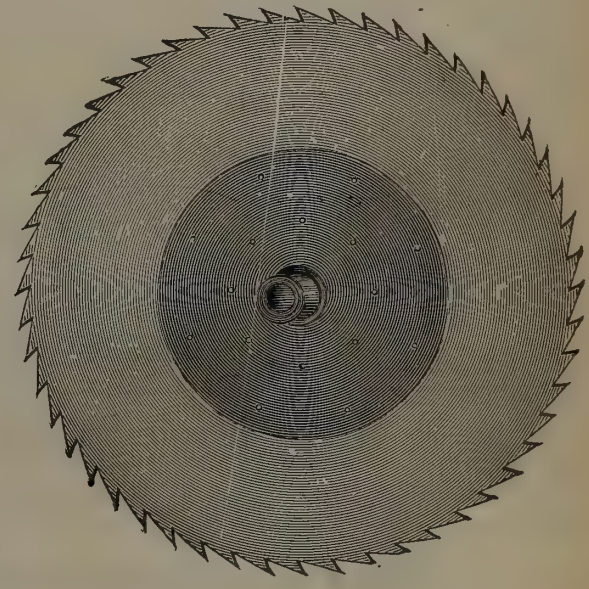
Notice the improved shank. We call particular attention to the swell which strengthens it at the weakest part and which gives it more wear than the old style.

Shanks made in usual gauges and to fit your saws perfectly.

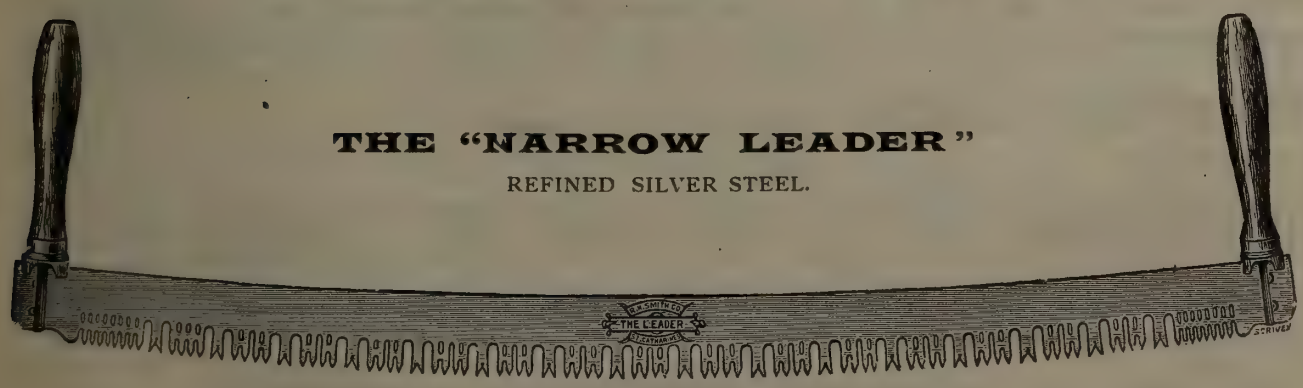
SHINGLE SAWS

The quality of the "Simonds" Shingle Saws is proven by the fact that the largest shingle and machine manufacturers in Canada are using them.

Run a "Simonds" and you will increase your output.



CROSS-CUT SAWS



The Simond's temper and style of tooth make the "Leader" the fastest and easiest cutting saw manufactured.

VOLUME XXIV. NUMBER 12. } TORONTO, MONTREAL, WINNIPEG, CANADA, DECEMBER, 1904 { TERMS, $1.00 PER YEAR Single Copies, 10 Cents

MR. W. K. GRAFFTEY.

We have the pleasure of presenting the portrait of Mr. W. K. Grafftey, Managing Director of the Montreal Lumber Company, Limited. Mr. Grafftey was born in Derbyshire, England, in the year 1849. His parents, coming out to Canada in the year 1856, settled in Owen Sound, where he obtained his early education and his subsequent business training, serving an apprenticeship of five years with Mr. William Kough, the famous hardware merchant of that town. Arriving in Montreal in 1869, he entered the employ of Benny, MacPherson & Company, wholesale hardware merchants, whom he served as traveller for several years.

Turning his attention to the lumber business, Mr. Grafftey took charge of the office of G. A. Grier, lumber merchant, with whom he remained in the closest business relationship for 20 years. The separation after these years of satisfactory experience was felt keenly, yet it opened the way for larger development. Others had noticed his business capacity and the formation of the Montreal Lumber Company, Limited, in 1897, was the result. Associated with him are men of the highest business integrity and influence, including Geo. I. Dewar, the Ottawa manager of the Export Lumber Company; John McKergow, of the firm of A. A. Ayer & Company, the largest shippers of cheese in Canada, and others, who form the company for which he acts as manager.

During the spring of 1900 the subject of our sketch visited England and laid the foundations for English trade, and while there the great fire of Hull and Ottawa occurred, marring the prospects for that year. Although handling all branches of the business, of which he has a thorough knowledge, the principal line to which he devotes attention is Ottawa white pine.

Success has attended the company since its formation and it is now recognized as a strong factor in the Ottawa district. They have handled large contracts for the city of Montreal and the Montreal Harbor Commissioners and are supplying the material for the extensive plant of the Singer Manufacturing Company at St. Johns, Que., which included in one order over a million feet of spruce.

Mr. Grafftey is a gentleman much respected in the community, careful in his operations, ready to take a fair risk, but always loyal to the obligations he makes, so that he commands confidence and respect from all who know him. He takes no active part in municipal or political matters, yet finds time when called on to do his part in any good work.

Our sincere good wishes accompany this short notice of a thorough lumberman and a worthy friend.

BRIQUETTING AND CARBONIZING SAW MILL REFUSE.

Dr. Rolof Juergenson, of Prussia, Austria, has lately been in the United States and Canada for the purpose of giving information regarding the Heidenstam patents for the transformation of sawdust and waste wood into charcoal without agglomeration and for the recovery of all secondary products. The process is the invention of a Swedish engineer, Gustave v. Heidenstam, of Stockholm. The

MR. W. K. GRAFFTEY,
Managing Director of the Montreal Lumber Company.

principal points of the process are the following :

Sawdust and waste wood are to be freed from moisture in a suitable way. The dry material is to be pressed in a continually working press, like the well known lignite coal press, into briquettes. Then it undergoes destructive distillation under mechanical pressure in suitable coaling apparatus.

The pyrolignous acid and tar vapors which are escaping during the coaling process are condensed in special coolers and the liquids derived therefrom stored in receptacles for further treatment into commercial chemical products, as acetic acid, methylated spirits, acetone, etc., the yield of which in treating hard wood waste has proved exactly the same as from best beech or oak wood.

The wood tar which is formed by cabonization contains about 50 per cent. of pitch. But what gives to this process its characteristic value is highly interesting. Only the tar oils of lower boiling point are escaping with the pyrolignous vapors, carrying on in solution a little part of pitch, while the main quantity being of high boiling point by action of the mechanical pressure, remains in the fibres of the carbonizing waste wood briquettes, cementing same, and is finally changed into carbon, forming an intimate dense charcoal briquette with the same.

The arrangement for a coaling apparatus under pressure for waste wood and sawdust briquettes in connection with a sawmill will take place in this way :

Sawdust and shavings containing 50 to 60 per cent. of moisture are to be reduced to 25 to 30 per cent. The wood refuse having been dried in a special apparatus by the waste heat leaving the coaling apparatus, enters into the briquette presses, producing briquettes in the form of cords, advancing mechanically to the changing apparatus of the coaling retorts.

The coaling retorts consist of vertical iron cylinders to be put into ovens of special construction and fireplace. The cylinders are fitted with outlet pipes on the bottom to give way to the by-product vapors. On the head they have cast iron covers on which the pressing cylinder is fixed, the piston of which works directly on the briquettes during the coaling operation of 14 hours' duration.

The charcoal discharged from the apparatus will be absolutely cooled in 12 to 14 hours.

This coal has been tested by calorimetrical analysis of the Stockholm Technological Government Institute to be of a caloric power of 7,800 calors and density of 0.6.

The further treatment and rectification of the pyrolignous product is exactly the same as practiced in the well known and well paying wood distillation industry, and the output of chemical products by the Heidenstam process is proved to be equal, if not superior, to that of best beech or oak wood.

The acetate of lime produced is used to make acetic acid and acetone, both highly important products of the chemical industry.

Another product is the wood tar, which is exactly of the same quality as the well-known Finnish or Swedish tar-fluid and of light brown color, if produced from waste of soft wood, as pine, fir, etc.

The great economy of this simple process is said to consist in mechanically conveying the waste wood from its accumulation in the saw mill, dried and pressed, direct to the charging apparatus in the coaling oven.

Considering the great difficulties for most of the sawmills to get rid of their waste wood and sawdust, the lumber industry will, no doubt, highly appreciate the importance of the Heidenstam process.

A MODERN SAW MILL.

Among the many saw mills on the shores of the Georgian Bay, that of Tanner Bros. at Waubaushene ranks high in its equipment and management. The mill was started thirty years ago by the father of the present owners. About ten years ago, Messrs. G. M. and W. H. Tanner, the present proprietors, assumed control, and five years afterwards rebuilt the mill, extending its size and capacity, and it now covers a large area on the shore of the bay.

The main building is 142 feet long by 40 feet wide, with a transfer wing 40 × 60 feet. In addition to this is a lath mill 30 feet square. A separate solid brick and stone boiler house, with three boilers of a total of 250 horse power, complete the buildings.

The average daily capacity of the plant is from 60,000 to 80,000 feet per day. The mill contains two single cut band mills of the Allis improved style. Up to last spring one band mill and a circular saw were employed, but the latter was taken out and replaced by another band mill, a second engine also being added. The interior photograph shown herewith was taken previous to the latter installation. Steam loaders, steam niggers, and steam kickers are also employed.

Every machine is placed upon an independent concrete foundation, and nearly all were supplied by the Waterous Engine Company, of Brantford, Ont. Everything is done in an orderly and systematic manner. All the rough edged lumber is carried away by chains to the edger, the stock lumber continuing its course over live rolls to the transfer table, where it is trimmed, marked, and loaded on cars for the pilers. Meanwhile the slabs are dropped automatically on to the slash table, where they are cut into four feet lengths. Here they are sorted, those suitable for lath being culled out, and the remainder dropped into a hopper and carried away to the yard. All the edgings and refuse from the lath mill are tied up on the spot and dropped into another hopper. Five carts are sufficient to handle all the refuse.

Since the new mill was erected five years ago, about 40,000,000 feet of lumber has been sawn, and yet the owners claim that less than $500 would cover the cost of repairs in that time. Mr. G. M. Tanner looks after the mill and the shipping, while Mr. W. H. Tanner has charge of getting out the stock. The piling yard capacity is equal to about 10,000,000 feet, and the lumber cut is entirely white and red pine.

Adjoining the mill is a large booming ground capable of holding eight million feet of logs. The timber limits of the firm are located on the Spanish and French rivers, and cover an area equal to four townships, half of which have not yet been touched.

AUTOMATIC ELECTRIC SAW MILL.

A Swiss firm have been making experiments in the direction of an automatic electric circular saw mill, in which the saw is fed along the log instead of the latter being fed to the saw. There are two kinds of mills being experimented with—log saws and resaws. In the log saw mill there is an iron track, which is made fast to the middle line of the log by means of clamps extending down to grip the center of the log. On this track there runs a carriage which bears a small electric motor; there is also upon the under carriage a cross-carriage which can be rotated about a vertical axis by means of a handwheel and screw. On the cross side or carriage is borne the principal motor that carries the saw.

A correspondent of the Wood-Worker says that the carriage is fed along the track by means of the small motor, and during the cut the large motor runs the saw through the wood. The cross-carriage or slide permits feeding the saw across the log the width of the desired board, plus the kerf. The arrangement by which the carriage can be turned about a vertical axis enables the saw to be turned ninety degrees about such axis and make the cut in the reverse direction at the same speed as during the first cut, thus saving the time necessary to run the carriage back, also avoiding the shock at the reversing points in both directions.

Of course, power can be brought any desired distance to the machine, by the usual insulated wires. Logs up to a diameter of 70 centimeters, or say, 28 inches, can be cut by a saw of 180 centimeters, or say, 6 feet diameter. Logs of greater diameter than 28 inches are first sawed from above to the depth that the saw can handle, then turned 180 degrees about their axis, so as to bring the kerf directly under the former line, then a second set of cuts is made, meeting the former ones. This seems to be the weak point of the invention, as very little lost motion in the machine will make the kerfs "come blind".

The resaw is lighter and more simple. The balks or planks are laid on round wooden supports and piled up to the maximum height of 30 centimeters, or, say, one foot. The planks are clamped together. The track and carriage are then set on the pile and fastened thereto by clamp bolts at the ends.

The inventor is a Herr Kottman, who has a plantation on the island of Sumatra. The invention was made by reason of the difficulty which he experienced in the primeval forests with the mills of the present construction. The largest and best trees could not be sawed in place. The new system does away with this disadvantage. For small logs the power required, including the loss in transporting the current 3,000 meters, or, say, 3,250 yards, is about 60-horse. The same amount of power does for two resaws. In order to work advantageously it is desirable to have at work together two log saws and three sets of tracks. While one log is being sawed, the second machine and track are being mounted on a second log, and the third track clamped to a third log.

VIEWS OF THE SAW MILL OF TANNER BROS., WAUBAUSHENE, ONT.

NEW LUMBER SECTION.

A Woods Section has been formed in connection with the Toronto branch of the Canadian Manufacturers' Association. The following are the officers: Convenor, R. S. Gourlay, of Gourlay, Winter & Leeming; Committee, J. Phillips, of Cobban Manufacturing Company; William Smith, of J. B. Smith & Sons; W. J. McMurtry, of Gold Medal Furniture Company; A.H.J. Eckardt, of Eckardt Casket Company.

REDUCTION IN FIR STUMPAGE.

The New Brunswick Government have reduced the stumpage on fir in accordance with the request of the Lumbermen's Association. The reduction is from $1.25 to 80 cents per thousand superficial feet, and took effect about two months ago.

BAND VERSUS CIRCULAR FOR SMALL LOGS.

Whether the band or the circular saw is the more economical for the manufacture of small logs is a question in which mill men are greatly interested—some being of the opinion that with the band saw there is very little, if any, saving in lumber, although there may be some saving in slabs. The Waterous Engine Works Company, of Brantford, Ont., have been experimenting with the cutting of small logs by a band mill, and state that the smaller

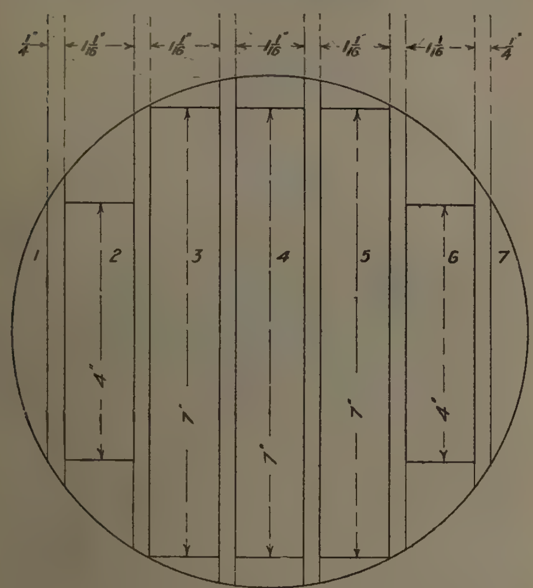

Fig. 1.—8″ Log, cut with Circular Saw, 7-Gauge, Kerf ¼″.

the log the larger is the percentage of saving in good lumber. To demonstrate the accuracy of this statement they give the following examples :

Let us consider that we have a circular saw mill and 8 in. logs to cut, using a saw to do the work having a kerf of ¼″. Fig. 1 illustrates the method of sawing, and we find that we get two slabs marked Nos. 1 and 7, two 4″ boards Nos. 2 and 6, and three 7″ boards Nos. 3, 4 and 6, or producing lumber 29″ wide by 1 1/16″ thick.

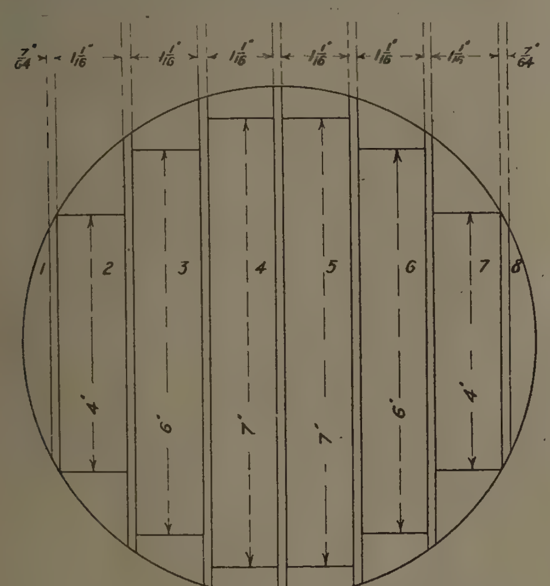

Fig. 2.—8″ Log, cut with Band Saw 16-Gauge, Kerf 7-64″.

By using a band mill with a 16 gauge saw, taking out a 7-64 kerf, we cut our log as shown in Fig 2, which results in two slabs Nos. 1 and 8, two 4″ boards Nos 2 and 7, two 6″ boards Nos. 3 and 6, and two 7″ boards Nos. 4 and 5, or producing lumber 34″ in width by 1 1-16″ thick, a gain of 5″ per foot in length of log.

If these mills each cut a thousand logs 8″ iamater and 12 ft. long, the output of lumber for the circular would be 29,000 feet, and for the band 34,000 feet, or a gain of 5,000 feet for the band, which is equal to 17¼ per cent.

If we take a 6″ log and cut it with the same circular saw having ¼″ kerf, we would obtain, as Fig. 3 shows, two slabs Nos. 1 and 5, one 4″ board Nos. 4 and two 5″ boards Nos. 2

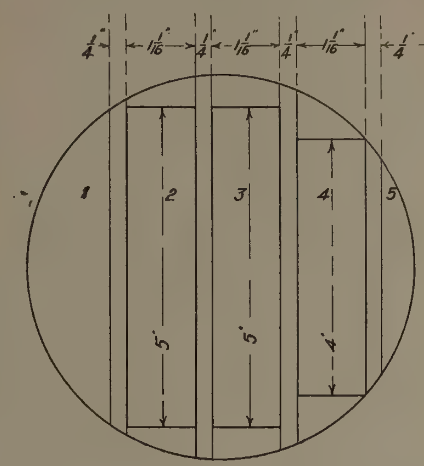

Fig. 3.—6″ Log, cut with Circular Saw, 7-Gauge, Kerf ¼″.

and 3, or producing lumber 14″ wide by 1 1/16 in. thick.

Cutting this 6 in. log with the band mill having a 16 gauge saw with a kerf 7/64, according to Fig. No. 4, will give us two slabs No. 1, 6 two 4 in. boards No. 2 and 5, and two 5 in. boards No. 3 and 4, or producing lumber 18 in. wide by 1 1/16 in. thick, a gain of 4 in. per foot in length of log.

If these mills each cut a thousand logs 6 in. diameter and 12 feet long, the output of lumber for the circular would be 14,000 feet and the band 18,000 feet, or a gain of 4000 feet in

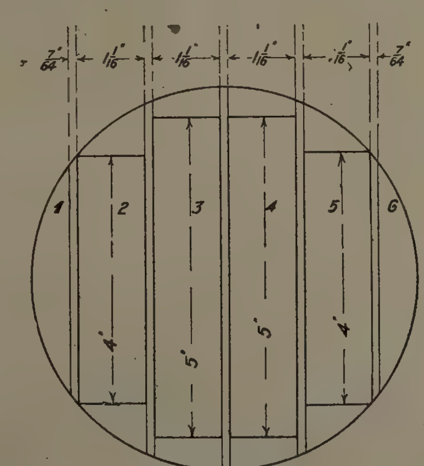

Fig. 4.—6″ Log, cut with Band Saw 16-Gauge, Kerf 7-64″.

favor of the band mill, which is equal to 28½ per cent.

If these mills cut on small logs, say 30,000 feet of lumber per day, and we presume that they have an equal number of 8 in. and 6 in. logs, the gain would be 21 per cent., or 6,300 ft. to the credit of the band mill.

Taking the value of this lumber at the mill at $12.00 per M, this would amount to $75.60, a fair day's profit.

The sawing season in this country (where the winter shuts us up for about half the year) is called say 160 days, and a saving of $75.60 per day amounts to $12,096.00 for the season. We know of lumbermen who are permitting their old circular saws to waste that amount of value every season.

We have compared the band mill with a circular saw taking ¼″ kerf, and are informed by one of the largest and most progressive lumberman that the most of the circulars in use take that amount or more and very few less.

The cutting capacity of a mill depends largely upon the men who handle it ; a circular saw will undoubtedly cut faster than a single cutting band mill on small logs, but the difference—if any—in the output between a double-cutting band and a circular will be very small and the band mill will do far nicer work.

THE FORESTS OF CANADA.

The first of a series of lectures on the resources of Canada, under the auspices of the Political Science Club of Toronto University, was delivered in the Chemical Building on Monday evening, November 14. The speaker was Mr. E. Stewart, Superintendent of the Dominion Forestry Department, and his subject "The Forests of Canada. He spoke on the forest resources, their origin, legitimate use and proper conservation.

Mr. Stewart traced in a very interesting manner the growth of the forest, from the evaporation of the water in the sea, its transportation, its condensation, and finally its dissipation and reservation in the vast forests of the country. The people of America had been profligate in their use of these great resources, continued Mr. Stewart, and they were now paying the inevitable penalty in the form of annual spring floods and destructive freshets. He strongly advised the provincial governments to protect their watersheds by inserting a clause in their timber patents providing that at least 10 per cent. of the timber should be left on all grants. The vast water-power resources of Canada, he said, were threatened by the wholesale destruction of forests which were the permanent sources of these streams. Only seven countries in the world to-day were able to export any timber, and this number, owing to practical difficulties in transportation, was limited to only three real exporters, namely, Sweden, Finland and Canada. To Canada would fall the lion's share of this trade if she but properly husbanded her resources.

Forestry, as erroneously supposed, did not attempt the conservation of timber, but on the contrary, the production and proper use of trees by scientific methods. A system of planting trees on the co-operation plan had already been inaugurated in the North-West, and the system would be further expanded. Already the Dominion Government had secured twelve large reserves protecting important watersheds, and are now on the lookout for more.

In conclusion, Mr. Stewart drew attention to the fact that our forests were not merely a mine of wealth, but an inexhaustible source of income, were they but properly developed. A number of interesting lantern views illustrative of his remarks were shown at the close of the lecture.

The man that reads the trade papers doesn't know it all, but he has a mighty good chance to know more than the fellow that doesn't read them—and he generally does, too.

THE ARROWHEAD LUMBER COMPANY'S MILLS.

The above company was organized in the summer of 1903 as a joint stock company under the laws of British Columbia and with a capital of $250,000. The directors of the company are: Archibald McMillan, of Westbourne, Man., president; Thos. Meredith, of Yorkton, N. W. T., vice-president; W. W. Fraser, of Emerson, Man., secretary-treasurer; W. R. Beatty, of Arrowhead, B. C., managing director; George McCormick, M. P., of Kamloops, B. C., and Alex. McMillan, of Winnipeg, Man.

The construction of a mill was immediately undertaken and on June 19th, 1904, the first lumber was produced. The location of the mill is on the north shore of the Upper Arrow Lake, about half a mile east of the town of Arrowhead, B. C., and occupying a site of about twenty-five acres. It is one of the best designed and most modernly equipped mills in the Province, and reflects great credit upon the manager, Mr. Beatty, by whom it was designed. The capacity of the mill is 100,000 feet in ten hours.

Besides the mill proper, there are a warehouse 32x70 feet built at a point convenient for loading or unloading either by boat or rail, a three-storey boarding house 32x70 feet, a two-storey office building 30x50 feet, finished in native woods, and a machine shop 20x40 feet. The equipment of the latter consists of a planer, large lathe, two drill presses, bolt cutting machine, and two forges, power being supplied by a 20 h. p. horizontal engine.

The mill consists of two buildings, one being 48x120 feet, three stories high, and the other 30x126 feet, twe stories high. The planer room is 48x72 feet with floor beneath for actuating machinery. The boiler room, which is of fire-proof construction, is 50x60 feet. The refuse burner is 34 feet in diameter and 80 feet high, built of heavy tank steel lined with brick and surmounted by a dome of underwriter's fire screen. This burner was constructed entirely on the ground, the steel having been rolled, punched, erected and rivetted by the company's employees in their own shops.

Power is supplied from a battery of four boilers, each 72 inches in diameter, equipped with "Dutch" ovens and operated at 125 lbs. pressure. The setting is of brick and stone and the floors are cement. The fuel supply is automatic, sawdust being delivered into the ovens by chain conveyors, while the refuse from the planer is delivered by pneumatic draft. Storage bins are provided to receive the surplus of fuel, which is used in the night to keep steam up for the use of the kiln and for fire protection purposes. The smoke stack is 6 feet in diameter and 105 feet in height from the roof of the boiler house.

The engines are two Waterous high pressure, each 20 inches diameter by 24 inch stroke, operating on one shaft. These engines operate at 105 revolutions per minute. Power is transmitted to the main shaft by a 38 inch double leather belt, from whence it is distributed by an efficient system of gears and belts to the various machines.

The electric light plant is situated in a room adjoining the engine room, and consists of a 500 light multipolar dynamo, manufactured by the Canadian General Electric Company, of Peterboro, Ont., direct-connected to a 90 h. p. McEwen automatic engine, built by the Waterous Engine Works Company, of Brantford. The different circuits are controlled from a fine grey marble switchboard on which are mounted the usual electrical measuring instruments and safety switches. The electrical equipment was furnished and installed by the Hinton Electric Company, of Vancouver.

MILLS OF THE ARROWHEAD LUMBER COMPANY, ARROWHEAD, B. C.

WATEROUS DOUBLE CUTTING BAND MILL
Installed in The Arrowhead Lumber Company's Mill.

THE MILL EQUIPMENT.

The equipment of the saw mill consists of a double cutting band mill, shown herewith, 50 inch Wickes gang, large double edger, slash table and trimmers. The mill is furnished throughout with modern steam handling apparatus, such as log-loaders, niggers, kickers and stock transfers, by means of which a great economy of labor is effected. A well-devised system of carriers conveys all the refuse from the various machines. Logs are delivered into the mill by an endless chain of exceedingly heavy construction and are delivered to the saw carriage by an ingenious arrangement of steam "kickers" and log-loaders. Every precaution has been taken against accident by efficient guarding of the machinery and by providing ample room for the workmen.

The logs go from the double-cutting band saw to the gang saw, which takes from one to four logs at one cut, delivering the whole in sawn lumber on to the trimmer table. The lath machinery is located conveniently to the slab slasher so that the stock is easily picked out for their manufacture. On the main conveyor to the refuse burner a workman is located, whose duty it is to select and throw out those slabs which are suitable for fuel.

The dry kiln is 44x120 feet and heated by live steam on the natural draft principle. The building is of "slow-burning construction," dimension lumber being laid on its flat and well spiked together. This is said to be the most nearly fire-proof of any form of wooden construction.

The planer equipment consists of three large "Invincible" planers built by the Berlin Machine Works, of Beloit, Wisconsin. This department is also supplied with a cut-off saw and a re-saw for the manufacture of bevel sid-

ing. Power is furnished by a 12x14 Waterous high speed engine.

Special precautions have been taken against fire. A large steam pump is installed in the engine room, and a system of pipes leads to hydrants at various points on the mill floor and in the yard. Hose is attached to these hydrants in readiness for immediate use. Two large hose reels are also provided for use in the yard. The company have constructed a reservoir of 60,000 gallons capacity, situated at a point on the hillside, which will give a pressure of 60 to 65 lbs. per square inch on the mill floor. The buildings are roofed throughout with iron and are carefully lime washed inside.

A noteworthy feature of the construction of the mill is the foundations which are placed under the engines and the gang saw. In order to get above high water level it was found

MR. W. R. BEATTY,
Managing Director Arrowhead Lumber Company.

necessary to build these concrete foundations 25 feet in height, necessitating a vast amount of material and a great deal of labor.

Owing to the formation of the shore it has been found necessary to construct all of the piling room, which has been done by means of pile driving. The platform is nearly a quarter of a mile long, varying in width from 90 to 150 feet. On this platform a system of steel rail track is laid, upon which are operated the lumber cars to and from the mill. This platform parallels the siding which has been extended from Arrowhead station and will be very convenient for loading.

For logging purposes, the company have constructed at Deep Creek a logging chute half a mile in length. Their limits comprise ninety square miles along the shores of the Columbia river and the Upper Arrow lake, the logs being towed to the mills by the company's own tug.

Mr. W. R. Beatty, the managing director of the company, was a successful lumberman in Ontario. He is also well known in political circles, having been M. P. P. for Parry Sound for the past eight years.

The office management is in charge of Mr. W. B. W. Armstrong, who was associated with Mr. Beatty in the lumber business in the east.

The operating staff consists of J. D. Ken-

MR. W. W. FRASER,
Secretary-Treasurer Arrowhead Lumber Company.

nedy, mill foreman; J. J. Woodland, planer foreman; Rand Gibbons, shipper and yard foreman; J. H. Linton, head filer. The disposition of the product of the mill is in the hands of T. A. Cuddy, one of the best known lumber salesmen in the west.

CONVENTION OF COOPERAGE STOCK MANUFACTURERS.

The annual convention of the National Slack Cooperage Manufacturers' Association opened in the Cadillac Hotel, Detroit, Mich., at 10.30 a. m. on November 1. President Wylie, in his opening remarks, stated that the scarcity of timber would compel the price of elm staves to remain firm. The value of log run elm lumber was $25 per thousand, and in many cases it brought even more than this price. He suggested that curtailment should be the watchword of the trade. There was some discussion on the question of grades, during which it was stated that every millman had his own ideas as to what constituted a No. 1 stave or a mill run stave. Some put in low grades and were therefore in a position to accept a lower price for their stock. It was believed that a uniform grade would be a benefit to the trade. Some of the members advocated the adopted of a specification as to the quantity of staves which should constitute a car load and a committee was appointed to report on the question at the next regular meeting.

Mr. James Innes, of Chatham, Ont., read a paper on "The Necessity of Understanding the Manufacture of Cooperage Stock before Entering the Business," and Mr. W. C. Hartman, of Detroit, submitted a paper on "Sales-

MR. GEO. MCCORMICK, M. P.,
Director Arrowhead Lumber Company.

manship in the Cooperage Stock Business." The Canadian Cooperage Manufacturing Company, Galetta, Ont., and John Hayne, Brigden, Ont., were admitted as members of the association.

Those present at the convention from Canada were: H. L. Merritt, Blenheim; John Hayne, Bridgen; D. K. Menzies, Niebergall Stave and Lumber Co., Staples; H. D. Chapman, Canadian Cooperage Co., Galetta; A.A. Scott, McGregor; Edw. Smith, Leamington; W. H. West, Jas. Innes, Mr. Fleming, Sutherland-Innes Co., Chatham; Neil Watson, Mull; J. L. Reaume, J. L. Reaume & Co., Essex.

ADVERTISING RATES ON APPLICATION.

THE CANADA LUMBERMAN is published in the interests of the lumber, wood-working and allied industries, being the only representative in Canada of these important interests. It aims at giving full and timely information on all subjects touching these interests, and invites free discussion by its readers.

Especial pains are taken to secure for publication in the WEEKLY LUMBERMAN the latest and most trustworthy market quotations throughout the world, so as to afford to the trade at home and abroad information on which it can rely in its operations. Subscribers will find the small amount they pay for the CANADA LUMBERMAN quite insignificant as compared with its value to them. There is not an individual in the trade, or specially interested in it, who should not be on our list, thus obtaining the present benefit and aiding and encouraging us to render it even more complete.

Advertisers will receive careful attention and liberal treatment. For manufacturing and supply firms wishing to bring their goods to the attention of owners and operators of saw and planing mills, wood-working factories, pulp mills, etc., the CANADA LUMBERMAN is undoubtedly the cheapest and most profitable advertising medium. Special attention is directed to "WANTED" and "FOR SALE" advertisements, which are inserted in a conspicuous position on front page of the Weekly Edition.

TWENTY-FIFTH ANNIVERSARY NUMBER.

Away back in the year 1880 the first number of the CANADA LUMBERMAN was sent on its mission. From that time to the present it has continued to be the sole exponent of the Canadian lumber industry, and is now entitled to rank among the oldest publications of its kind in the world. The publishers have considered it appropriate to distinguish in some manner this twenty-fifth year of the journal's existence, and this it is proposed to do by the publication of a special number, to be designated a Twenty-Fifth Anniversary Number and to be issued on January 1st, next.

We prefer to let the number speak for itself, but the aim is to make it the most attractive and interesting edition of a trade journal ever published in Canada. The pioneers in the business will tell of the early methods of lumbering; others will review the development in the various branches of the industry, contrasting the conditions of to-day with those which existed twenty-five years ago; statistics of the lumber production for the quarter century will be given, and as far as possible features of special interest and particularly adapted to a number of this character will be introduced.

Besides the large circulation which the journal enjoys, several thousand extra copies of this number will be printed and circulated in every part of Canada and abroad. To advertisers desirious of reaching the lumber and woodworking industries it offers a splendid opportunity. Regular advertisers have already arranged for enlarged spaces, and orders are in hand for many new advertisements. Others who may contemplate being represented in this number should reserve space at once, as no advertisement can be accepted after the 29th inst.

INFLAMMABILITY OF BUILDING TIMBER.

There has recently been a great deal of discussion about the fire extinguishing facilities in Toronto, and the Underwriters are clamoring for additional water supply and new engines for the business district. It seems opportune, therefore, to enquire regarding the class of material that is being used in the construction of new buildings. An inspection of these shows that the interior construction is almost exclusively of steel and Southern pine, notwithstanding that it is a well-known fact that water has little effect in extinguishing fire in Southern pine owing to the excessive quantity of turpentine which it contains.

The difference in weight between Canadian white pine and Southern yellow pine shows approximately the amount of pitch in the latter, the former weighing when dry about 2,500 pounds per thousand feet B.M., and when green 3,200 pounds, while, according to weights given by the Southern Lumber Manufacturers' Association, Southern pine weighs 3,400 pounds when dry and 4,200 pounds when green. Surely when the Underwriters restrict the quantity of bulk turpentine that may be stored in buildings, it would be pertinent that they should see that the material of which the buildings are constructed does not contain a large proportion of this highly inflammable article.

It has been repeatedly demonstrated by fires that water runs off Southern pine like oil and has little effect upon it, while our Canadian pine absorbs the water and when the fire is extinguished the walls are left intact. Where water is applied early enough the charred woodwork will remain in place and carry weight.

If the architects allege that they specify Southern pine because it is cheaper, it may be pointed out that they obtain less material for a thousand feet from the South than from Canadian mills. For instance, Canadian mills furnish flooring $\frac{7}{8} \times 3\frac{1}{2}$ in., while from the south it is accepted $13/16 \times 3\frac{1}{4}$ in.—a difference in quantity of 15 per cent., which increases the price of Southern pine in comparison with white pine. Further, in the case of joisting, Canadians are asked to furnish this material when planed $1\frac{7}{8}$ in. thick, while Southern mills furnish it $1\frac{3}{4}$ in. In dressed timber there is almost a corresponding shortage in the quantity of yellow pine supplied per thousand feet.

It seems strange that Canadian architects should use Southern pine so extensively, while architects in Pennsylvania, Ohio, and other states give white pine the preference, even at much higher prices, on account of its better fire-resisting qualities and greater durability. It may be that arguments can be advanced in favor of the use of yellow pine; if so, such advantages should be of a very important character to offset the greater inflammability of the material.

THE PROBLEM OF LUMBERING.

The lumber business has made rapid advancement within the last half century and has fully kept pace with the general march of progress. Since the days of the muley saw for the manufacture of lumber, and the hand knife for the cutting of staves, one improvement after another has been perfected, until the operation of what we now term a modern saw mill would seem to represent almost the acme of science and invention. But with it all, the problem of successful lumbering has not been simplified; indeed, we almost question whether the difficulties and inconveniences which are encountered at the present time are not more pronounced than in the earlier days.

Improvements have been confined chiefly to mill equipment as the most natural field for the application of new devices. Manufacturing methods have been wonderfully modernized, but the plan of conducting woods operations has, quite naturally though, undergone no important change: It is, therefore, in respect to the cutting and transportation of the timber that the operator of to-day is confronted by problems which give him the most concern.

Lumber, like every other commodity of common use, is affected by periods of prosperity and depression. The maximum in demand is usually reached at a time when the country generally is in a prosperous condition and labor fully employed. At each recurring period of this nature, greater difficulty is being experienced by lumbermen in obtaining men to work in the woods and in retaining them after once engaged. The high wages which prevailed during the past two winters seemed insufficient to induce men to submit to the trivial hardships associated with life in the woods; the industrial activity of the more thickly populated districts, where work could always be obtained, proved too great an attraction. The severity of last winter also tended to discourage the woodsman and make his labors unpleasant. It was likewise disheartening to the operators, who have no desire to experience another such season.

Turning to physical conditions, the question of moving the logs from the limits to the mill is one which, as time goes on, is becoming a more difficult problem. The source of the timber supply is gradually becoming further removed from the consuming markets, and in many cases from the saw mills. Transportation by means of water channels is still the common method, but the greater distance means increased expense and more liability of having the logs hung up on account of the longer period which must elapse before they reach their destination.

The construction of railroads for the transportation of logs means a heavy expenditure, but this method is recognized as possessing advantages over a water route, affording greater security, and being quicker and cheaper after once the road is built. In the United States logging railroads have been extended into many districts where a few years ago it was not considered that the timber would be accessible. In Canada a few logging railroads are in operation, and as these increase in number the problem of the transpor-

tation of timber will become less troublesome to lumbermen. The extension of our railroad system will also enhance the value of standing timber. The greater value of the German forests may be attributed, in part at least, to the somewhat extensive railroad system in that country.

The past summer has witnessed the adoption in Ontario of an entirely new method of lumbering, the plan being one which should commend itself, as it does away entirely with winter logging. The saw mill is built on wheels, so that it can be moved through the bush to the timber supply. When the timber for a distance of, say, 200 feet is cut out, the mill is moved along to a new location and the process repeated. The cost of laying the track for transporting the mill is said to be small when compared with the advantages which the system possesses.

DECISION AFFECTING FREIGHT RATES.

Early in November the Canadian Railway Commissioners gave a decision in favor of the British Columbia Lumber & Shingle Manufacturers' Association in an action brought against the Canadian Pacific Railway Company in which it was alleged that the company had no right to charge a higher freight rate on cedar than on fir, spruce and hemlock lumber. The Railway Company is ordered to desist from making such discrimination.

As reported in our October issue, the C.P.R. have been charging forty cents per hundred pounds on fir, hemlock and spruce to Manitoba points and fifty cents on cedar, such rates applying to the Pacific Coast mills. The interior mills at the same time were given a preference of seven cents over the Coast mills on fir lumber, while the rate on cedar was seventeen cents lower than was given to the Coast mills. The British Columbia Lumber & Shingle Manufacturers' Association appealed to the Railway Commission, and the Railway Company endeavored to justify their action on the ground that owing to the lighter weight of cedar, the rate should be higher. Their explanation of the differential accorded the interior mills was that they did not manufacture clear cedar and were therefore at a disadvantage as compared with the manufacturers on the coast. The Commissioners decided that these arguments were not sound, and in their judgment designate the excess rate on cedar lumber as an unreasonable and excessive charge.

Subsequently the announcement is made that the Canadian Pacific Railway have entered a protest against the decision, basing their action on the clause in their charter which states that the railway shall not rduce its rates until the net earnings shall exceed one per cent. of the construction cost. The contention of the Commissioners is that, while they may not be able to interfere with the rates, they can prevent discrimination. It is believed that the question will eventually reach the Supreme Court.

The only lines on the American continent charging a higher rate for one commodity used for the same purpose as another are said to be the Canadian Pacific, Great Northern, Northern Pacific and Union Pacific. Other roads class as lumber all varieties of wood except high-class hardwoods. Considering the great desire of the C.P.R. to improve the position of the North-West farmer (if we may regard their recent attitude as sincere), does it not seem inconsistent to find them numbered among the few railroads which are endeavoring to increase the cost of his lumber supply? Is not this the same railroad whose management talked of establishing saw mills for the sole object of giving the farmer cheaper lumber?

EDITORIAL NOTES.

The lumber industry of British Columbia is now in a depressed condition as the result of an abnormal expansion in mill building. The present producing capacity is far in excess of the demand, and unsettled conditions promise to continue until the production is curtailed to a reasonable limit. That there is a great future, however, for coast lumbering is still everywhere admitted, and it is not too much to predict that before many years British Columbia will produce more lumber than any other province of the Dominion. Far-seeing capitalists are even at the present time buying up the timber limits, just as the white pine of Ontario was acquired a few years ago. One of the most recent transactions is the purchase of a timber tract in the Toba Valley of British Columbia by Messrs. B. A. Scott, F. F. Tillotson, D. L. Altland and Thomas Berry, of Detroit. The stand of timber on this tract is estimated at 600,000,000 feet, sufficient to keep a mill running for many years.

The Board of the United States General Appraisers have given a decision that, under the present tariff law, fire-proofed lumber must be assessed $2 per thousand feet as lumber, and not 35 per cent. ad valorem as a manufacture of wood. The testimony showed that the lumber had first been steamed, that the sap had been withdrawn and that a solution of sulphate and phosphate of ammonia had been injected, and that then it had been artificially dried. The Appraisers held that the lumber was still destined to be used as lumber, and that its subjection to a fire-proofing process did not change the purpose or use to which it would be applied. As a precedent to the decision, a previous case was cited in which the United States Supreme Court held that lumber which had been planed on one side and tongued and grooved was not a manufacture of wood, for its purpose and use remained the same.

LUMBER CAMP LIBRARIES.

A letter to the Minister of Education from the Rat Portage Lumber Company, applying for a travelling library for one of their lumber camps, says in part: "We find that the libraries have been greatly appreciated, and we wish to thank you for the interest you have taken in this matter. If you would allow us a suggestion, however, we would say that a considerable number of the books supplied seem to be rather above the class of men in the camps, and that a larger percentage of good, up-to-date fiction would be very acceptable. The men never seem to tire of reading stories by Ralph Connor, Conan Doyle, Thwing, Stuart White and Henty."

Trade Opportunities

BOX SHOOKS.

Mr. John B. Jackson, Commercial Agent at Leeds, England, writes to the Department of Trade and Commerce, Ottawa, under date of November 1, as follows:

Box shooks are very much in demand in Hull, and I have had various inquiries in regard to them. Box boards are manufactured very cheaply there, and as the freights from Hull to the Yorkshire points are very reasonable, goods can be sent all over the United Kingdom from there at prices that can more than compete with local manufacturers in the various towns, large quantities being sent daily to London, Liverpool, Manchester, Newcastle, Bristol, Glasgow and other principal towns, carriage paid from Hull.

SIZES AND PRICES.

The principal supply of shooks is from Norway, Sweden and Russia, at from 20 cents to 30 cents per cubic foot, manufactured, according to the thickness and widths required, c.i.f. Liverpool, Manchester, Newcastle and Hull. The following particulars of usual sizes and prices per cubic foot c.i.f. Hull, Manchester or Liverpool may be of interest:

Inside Measurement	Thickness Sides, top and bottom	Per cubic foot
12⅛ x 6⅝ x 4⅞	3-16	⅜ ends at 30½ cents.
10½ x 6½ x 2⅛	⅛	⅜ " 32½ "
16 x 15 x 5½ top and bottom in 3 pieces	5-16	9-16 " 24¼ "
18½ x 12⅜ x 16¼, 4 battens for ends 2½ x 11-16, top and bottom in 2 pieces, sides and ends in 3	5-16	11-16 " 24¼ "
9½ x 7¼ x 5⅜ lids planed sides, sides and ends planed on one side	¼	7-16 " 30½ "
16⅜ x 15⅝ x 9⅛	⅜	⅞ " 28½ "
27 x 5½ x ⅝		20 cents.
30 x 7 x ⅝		22 "
18½ x 8⅞ x 6⅜ tops in one piece, bottoms in 2 pieces	¼ & ½ thick	28½ "
14½ x 7¼ x 5⅛ lid and one side planed on one side only	¼ & ½ thick	27 "
25¾ x 15 x 17, 4 battens for ends 17 x 2½ x ¾ tops, bottoms, sides and ends in 3 pieces	¼ & ¾ thick	26 "

All sizes are not planed, unless otherwise stated.

What the importers here desire more especially is to get in touch with good firms either in New Brunswick, Quebec or Ontario, so that if a car-load or two were wanted it could be ordered by cable, and thus delivery made in five or six weeks' time. If this could be arranged a regular supply of orders for the various sizes could be sent and a good trade be done.

INQUIRIES RECEIVED.

By P. B. Ball, Birmingham, England: No. 92—A large firm in Birmingham wishes to get in communication with a firm in Canada who can supply them with dowel sticks.

By Harrison Watson, Curator Canadian Section, Imperial Institute, London, England: No. 103—A firm invites correspondence from Canadian shippers of hardwood in a position to handle export trade. No. 107—An Irish firm of timber brokers report a good outlet for Canadian hardwoods, and would be pleased to hear from Canadian shippers.

From J. B. Jackson, Commercial Agent, Leeds, England: No. 75—Manufacturers and importers of box shooks, box boards, wood fibre and wood rope are anxious to get in direct communication with a large mill in Canada in a position to ship box shooks, &c., to England.

By Department of Trade and Commerce, Ottawa No. 44—Wanted by a French dealer, names of Canadian wood pulp shippers. No. 48—A French manufacturer wants the names of veneer manufacturers in Canada.

The names of the firms making the above enquiries, with their addresses, can be obtained upon application to the Superintendent of Commercial Agencies, Department of Trade and Commerce, Ottawa. Mention the reference number and the Commercial Agent in each case.

ECONOMICAL MANUFACTURE OF SMALL LOGS.

OTTAWA, November 12th, 1904.

Editor CANADA LUMBERMAN :

DEAR SIR,—The increasing scarcity of large timber or logs that will average 12 inches or over is bringing home to the manufacturers of lumber the necessity of arranging their mills for a more economical method of handling the increasing quantity of logs which run under rather than over 12 inches. Many firms are now taking out logs, in lengths from 12 to 24 feet, that will not scale over 1000 feet for every 25 logs.

To economically manufacture such material into lumber necessitates the rapid handling of a large number of small pieces in order to make any kind of a satisfactory showing. I would like to ask your numerous readers their opinion as to the best method of handling such material, cutting it into the following sizes of lumber, viz., 5/8x3" to 9" wide ; 1"x3" to 9" ; 2"x3" to 9" ; 3"x3" to 9", and 4"x4" to 6", and length from 6 feet up, spruce or pine. I think the discussion of this question would be of much interest and value to the lumber trade at large, and hope those interested will discuss the question fully in your pages.

Yours truly,

I. N. KENDALL.

A COMPARISON OF POWER TRANSMISSION SYSTEMS.

TORONTO, Nov. 19th, 1904.

Editor CANADA LUMBERMAN :

DEAR SIR,—With your permission I will endeavor to give a few perhaps interesting facts on power transmission by rope.

The question may be asked, what is the oldest method of power transmission. Gearing is the oldest method ; it is positive in its action, and is claimed to operate with less loss of power by friction than any other method. But as a means of transmitting large powers, this method is fast disappearing, for the following reasons :

A failure of one part is almost sure to be fatal to the whole. It is expensive in first cost as well as in erection and maintenance, and is very objectionable on account of noise, although in some cases it might be an advantage, especially with small power.

Belting comes next as a method of transmission, and can be used to advantage where high speed is to be obtained on account of its flexibility, or where it is necessary to shift from a tight to a loose pulley. But it also is expensive in first cost, and when large power is to be transmitted the great width necessary makes belt driving not only uselessly extravagant but also difficult to install.

Then again, all belting requires perfect alignment of shafting and has a large percentage of slip, especially on cast iron pulleys, and as a result loss of power. I have personally seen cast iron pulleys become so warm on account of the belt slipping that I could not hold my hand on the pulley. Hence belts have to be made so taut to do the required amount of work, that there would be a loss of power by friction in the bearings and sometimes cause heated bearings. Where this occurs it would be of advantage, if the pulleys would permit, to use lagging, as it is a well known fact that wood pulleys or pulleys lagged with wood will actually give from 25 to 60 per cent. more power, being guaranteed to that extent, providing the same belt is used and with like tension of belt. Belting like gearing is also noisy in operation and produces electrical disturbances.

Electricity as a means of transmitting power has considerable merit and for long distances its advantages are unexcelled. For example, a factory in California is driven from a power house 250 miles away. But for ordinary mill practice of to-day this method has not reached a sufficient state of perfection or economy in installation to justify the millmen in adopting it in place of belts or rope.

It is only within the last few years that the use of ropes as a means of transmitting power has received the general recognition of millmen. This system having forced its way to its superiority as main drives, is now superseding all others in new plants both in Canada and the United States, and in some places is used entirely throughout the factory. This is especially noticeable along the great lakes, where numerous grain elevators are found, in which belting has entirely disappeared. Below are some of the most prominent advantages peculiar to rope driving and which engineers and millrights are taking note of.

First.—The distance and direction in which power can be transmitted is practically unlimited. In one of Hawkins' books on Mechanical Engineering the following table is given comparing the four greatest powers of transmission, namely : Electricity, Air (pneumatic), Water (Hydraulic), and Rope.

Distance of Transmission in feet.	Electricity.	Hydraulic.	Pneumatic.	Rope.
300	.69	.50	.55	.96
1,500	.68	.50	.55	.93
3,000	.66	.50	.55	.90
15,000	.60	.40	.50	.60
30,000	.51	.35	.50	.36
60,000	.32	.20	.40	.13

Hence it is seen that rope is more effective up to about three miles, beyond which electricity and pneumatic powers are more effective.

Satisfactory driving may be done where the distance between shafting is as great as 175 feet without the aid of carrier pulleys. With carrier pulleys the distance may be prolonged indefinitely. On the other hand, successful driving can be done with ropes where the shafts are close together. There are now in operation many drives where the shafts are but 10 feet apart.

Second.—The amount of power that can be transmitted with rope is also practically unlimited ; for instance, there are several drives in the United States which are transmitting from 3,000 to 4,000 horse power, of which I might mention the rod mill drives of the Sharon Steel Company, which is by multiple system ; 60 ropes 2 inches in diameter are used.

Third.—Economy in first cost and maintenance. In drives of 200 h. p. and upwards and where the shafts are from 20 to 30 feet apart, the cost as compared with belt drives will vary from 10 to 30 per cent., according to the distance and size of drive. This advantage increases rapidly as the distance apart of shafts and amount of power to be transmitted increases.

Fourth.—Small cost and maintenance of a rope drive is a strong point in its favor. The average life of a rope on a properly constructed drive is from five to ten years, providing that the rope is running free from obstructions and the speed of the rope is not more than about 4,500 to 5,000 feet per minute, and in that time all the care that it needs is proper splicing, which is a simple thing when once the idea is grasped.

Fifth.—Economy of space. The width of rim space required is from one-half to two-thirds that of belting, varying with the size of rope used. It is also positive power where the angle of the grooves are 45 degrees ; also when calculating for speed no allowance need be made for slipping of rope as is usually the case with belting. Further, it is steady running and absolutely noiseless, due to the flexibility of the rope and the air passage in the bottom of the groove, which usually is 9-16 of an inch. This holds good for large drives as well as small ones, notwithstanding that horse power is being transmitted in thousands and the ropes may be running a mile a minute. Another great advantage when wishing to convey power to a number of floors is that the full number of ropes start from the driving pulley, while the number for each shaft are easily dropped off at each floor.

Sixth.—The great advantage in future addition of power. This may be readily done by installing pulleys with extra sheaves, and when more power is wanted more rope is added, filling up the extra sheaves, where if it were belting, you would have to get a new belt because it would not be possible to splice a piece on the side of the belt.

There are two distinct systems of rope drives, namely, the multiple or English system, and the continuous or American system. The multiple system is the simplest, consisting of a number of independent ropes running side by side in the grooves of the pulley. It is claimed by some authorities that the life of the rope is longer on the multiple system on account of the rope always bending in the one direction, but I think this is doubtful.

In the continuous system one rope is wound around the driving and driven pulleys several times, the number of laps being according to the amount of power required. With this system it is necessary by some means or other to conduct the rope from an outside groove of the driver to the opposite outside of the driven. This is done by means of a travelling tension carriage whose duty is to do this as well as to secure a uniform tension throughout the rope. It is so arranged as to travel back and forth automatically, regulating the slack of the rope which occurs from the stretch in the rope, also irregularities of load. This should be so arranged as to take the slack where it accumulates, which is on the slack side of drive just off the driven pulley.

In the second way, where it is not convenient to take slack directly from the driving pulley, the same result may be obtained by taking it from the driven, the rope being led from an outside groove, which is a loose or independent sheave to the tension sheave, and thence returned to the opposite outside groove of the driven pulley. I think that splicing a rope is much easier accomplished than splicing a belt, being done in less time and requiring less tools. The proper splice is called a transmission splice, varying in length according to the size of rope used. One engineer has said that 95 per cent. of troubles in rope driving are due to bad splicing.

Much more could be said about rope driving, but time and space are limited. Thanking you, Mr. Editor, for the valuable space in your journal,

I remain, yours respectfully,

D. D. DAVIDSON.

OBITUARY.

Just as we go to press we learn, with profound regret, of the death of Mr. John Bertram, President of the Collin's Inlet Lumber Company. His demise took place on November 28th at his residence, 19 Walmer road, Toronto, after an illness extending over several months. About three weeks ago he was operated upon for appendicitis and from that time he gradually sank. Deceased was also President of the Bertram Engine Works Company and Chairman of the Dominion Commission on Transportation. His death is an irreparable loss to the country and to the lumber trade. A sketch of his career will be published in the January number of THE LUMBERMAN.

TRADE NOTES.

Henry Disston & Sons, Incorporated, have decided to establish a Canadian factory in Toronto.

Josiah Fowler, manufacturer of edge tools, St. John, N.B., recently returned from an extended trip to the Pacific Coast, where he arranged for placing his goods on the market there.

A. R. Wilson is building a new saw factory at St. John, N.B., which will be 40 x 100 feet, two stories, and built of brick. The ground floor, which will be used as a showroom and factory, will have concrete floors and a plate glass front.

The Hay Foundry, Limited, of Listowel, Ont., has been incorporated, to manufacture machinery and carry on the business of iron founders. The capital of the company is $40,000.

The Canada Machinery Company, Limited, is a new concern incorporated last month, to manufacture machinery of all kinds. The head office will be at Point Edward, Ont., and the directors include David Milne, Thos. Kenny and Charles S. Ellis, of Sarnia.

The American Axe & Tool Company, of Glassport, Penn., have decided to establish tool wooks in Canada, and are looking for a suitable location in Montreal or vicinity. The company have been doing a large Canadian trade, Mr. J. Hoffmann, of Montreal, being their representative.

On account of a recent large extension to their business in the Maritime Provinces and Newfoundland, Woods, Limited, of Ottawa, find their accommodation inadequate and are considering the erection of a large addition to their Slater street manufactory. This company manufacture a complete line of lumbermen's supplies for wood operations.

Among the orders recently received by the Gordon Hollow Blast Grate Company, the well-known manufacturers of blast grates, edgers and trimmers, of Greenville, Michigan, was one from the Dennis Bros. Salt & Lumber Company for their two mills near Tustin, Michigan, for two log haul-ups, two trimmers, two heavy edgers and two 10-saw slab slashers.

FORESTRY DEPARTMENT

CANADIAN FORESTRY ASSOCIATION.

At a recent meeting of the Board of Directors of the Canadian Forestry Association, final arrangements were made for the publication of a forestry journal in the interests of the Association and for the advancement of the forestry movement generally. Dr. Wm. Saunders, Professor John Macoun and Mr. E. Stewart were appointed an Editorial Committee and Mr. R. H. Campbell as Editor and Business Manager. The new journal will include scientific and descriptive articles relating to the Canadian forests and their management, forest administration in other countries, the planting and care of trees and such other related subjects as are of public interest. The aim will be to present the subjects in a popular style, so that it may appeal to the general public as well as to the scientific student. The number and standing of the contributors already secured give promise that the character of the magazine will do full credit to the Association and worthily represent forestry interests. The Association has steadily developed since its organization in 1900 and has now a membership of about six hundred, representing all parts of the Dominion and including also a number of foreign countries. One of the most recent additions to the life membership is Prince Colloredo-Mannsfeld, of Austria, who has been visiting Canada recently and takes a great interest in forest management, as he has large forest estates in Bohemia.

A resolution was passed expressing the opinion of the Board that in view of the annual destruction of timber in British Columbia and the difficulty of guarding the forests from fire, it is desirable that the Bush Fires Act of that province should be amended so as to prohibit the starting of fires for the clearing of land between the first day of May and the first day of November in each year unless a special permit for that purpose be granted by the forest ranger or other officer appointed for the district in which such permission is asked.

Preliminary arrangements for the annual meeting of the Association to be held at Quebec in March next were made. The prospects for a good meeting are very encouraging. The Government of the Province have promised their interest in making the meeting a success.

Resolutions of sympathy with His Honor Sir Henri Joly de Lotbiniere and with the family of the late Dr. W. H. Muldrew were passed.

Messrs. E. Stewart and R. H. Campbell were appointed to represent the Canadian Forestry Association at the Forest Congress to be held in Washington in January.

THE AMERICAN FOREST CONGRESS.

The official call for the American Forest Congress, to be held under the auspices of the American Forestry Association, has been issued. The dates fixed are January 2nd to 6th, 1905. The Congress will include :

Members of the United States Senate and House of Representatives ; Ambassadors, Ministers, and other representatives of foreign countries ; Governors of States and Territories; Members of the Society of American Foresters; Faculties of Forest Schools ; State Forest Officials; Professional Foresters in private work; 100 Delegates from the American Forestry Association ; Editors of Lumber and other Trade Journals of industries dependent upon the forest ; 25 Delegates from the Bureau of Forestry of the U. S. Department of Agriculture ; 25 Delegates from the United States Geological Survey ; 50 Delegates from the United States General Land Office and Forest Reserve Service ; 75 Delegates from the National Irrigation Association ; 75 Delegates from the National Irrigation Congress ; 5 Delegates from each Forestry Association, State or Local ; 10 Delegates from the Canadian Forestry Association; 5 Delegates from the Canadian Forest Service; 5 Delegates appointed by the Governor of each State and Territory ; 5 Delegates from each Lumberman's Association ; 5 Delegates from each Wood-Working Association ; 5 Delegates from each Mining Association ; 5 Delegates from each Stockmen's Association; 5 Delegates from each Turpentine Association ; 2 Delegates from each Railroad, Telegraph or Telephone Company ; 15 Delegates from the American Society of Civil Engineers ; 15 Delegates from the American Institute of Mining Engineers ; Chiefs of Bureaus and Divisions of the United States Department of Agriculture ; 2 Delegates from each Chamber of Commerce and Board of Trade ; Delegates-at-large appointed by the President of the Congress from forest landowners and those who have rendered distinguished service to the cause of American Forestry.

The subjects, each of which will receive attention at a separate session, are : 1. Relation of the Public Forest Lands to Irrigation ; 2. Relation of the Public Forest Lands to Grazing ; 3. The Lumber Industry and the Forest ; 4. Importance of the Public Forest Lands to Mining ; 5. Forestry in Relation to Railroad Supplies ; 6. National Forest Policy ; 7. State Forest Policy.

The sessions will be held in the National Rifles Armory, 920 G. street, Northwest. The railways have granted a rate of a fare and a third for the round trip, in order to secure which delegates must procure certificates at starting points. Hon. James Wilson, Secretary of Agriculture, has been chosen President of the Congress.

CANADIAN PINE IN GERMANY.

A letter has been received at the Geological Survey, Ottawa, from Baron Max Fuerstenburo, of the German Government Department of Forestry, saying that great success has been obtained in growing seeds of Canadian pine and other conifers. More seeds are to be secured to restock the forests of Germany.

C. C. Andrews, fire warden for Minnesota, says that the pine timber of that State will last only fifteen years longer.

Bulletin No. 1 has been issued by the Forestry Branch of the Department of the Interior, Ottawa. It is entitled " Tree Planting on the Prairies of Manitoba and the North-West Territories," the author being Norman N. Ross, Assistant Superintendent of Forestry. This bulletin has been compiled with the idea of affording practical information to the settler on the western prairies as to the best methods of propagating, planting, and managing hardy trees for shelter belts, wind breaks, and plantations. It contains much information on the subject, also 42 illustrations, some of which show very strikingly what can be accomplished by tree planting. Chapter 4, devoted to obtaining plant material, contains much information which is not common knowledge.

AGENTS WANTED EVERYWHERE. ADDRESS DOOR DEPARTMENT.

RONDEAU PARK FOREST.

Dr. Clark, Ontario Provincial Forester, and Mr. T. W. Gibson, Director of the Bureau of Mines and Secretary of Parks, returned recently from an inspection of Rondeau Park, in Kent County. The park, which is 40,000 acres in extent, is largely forest and the inspection was made in order to make a report upon a systematic method of managing the forest with a view to its perpetuity as a reserve. The examination disclosed the fact that the reserve includes a considerable quantity of white pine, six varieties of oak, three kinds of hickory, two of maple, besides beech, white and black ash, black walnut, which is now very rare in Ontario, and some tulip trees.

LONGEVITY OF FOREST TREES.

Information gathered by the German forestry commission assigns to the pine tree 700 years as a maximum length of life, 425 years to the silver fir, 275 to the larch, 245 to the red beech, 210 to the aspen, 200 to the birch, 170 to the ash, 145 to the elder, and 130 to the elm. The heart of the oak begins to rot at about the age of 300 years.

CHANGE OF AGENCY.

The Dodge Manufacturing Company, of Toronto, have completed agency arrangements with the Vancouver Engineering Company, Vancouver, B.C., and have just shipped out to them two car loads of Dodge standard wood-split pulleys, along with various other Dodge apparatus, which will enable the latter firm to better take care of the already well established demand for Dodge pulleys on the Coast. The trade are invited to note this change.

Mr. F. Goto, Forestry Commissioner of the Department of Agriculture and Commerce, Tokio, Japan, is at present visiting Canada and the United States with the purpose of collecting information regarding the forestry and timber resources of these countries. Mr. Goto states that a market exists in Japan for British Columbian Douglas fir for use in heavy construction. Japanese cedar does not attain a large enough growth for this purpose, although well adapted and largely used in the lighter forms of construction such as houses and other small buildings, for which brick is too costly. Beech is very plentiful and of large size in Japan, particularly on the mountain ranges which longitudinally divide the island, but is not adapted for lumber and is used only for fuel. Mr. Goto will return to Japan in February.

We are at your service for above and all other Businesses. Write at once for our book of "Business Opportunities." Address THE LOCATORS, Merchants' Bank Building, Winnipeg, Manitoba.

CURRENT TRADE CONDITIONS.

ONTARIO.

The close of the month of November finds the lumber trade of this province in a healthy condition. There is a seasonable volume of white pine moving from the yards to consumers, as the weather has been favorable for outdoor work. This is not the season when the demand is likely to increase, as there is always a disposition to curtail obligations towards the close of the year. Manufacturers are receiving a number of inquiries from United States dealers, but many of these are believed to be for the purpose of ascertaining the feeling of the trade as to prices rather than with a view to placing orders. The ready buyer has no difficulty in finding plenty of pine lumber of the common and higher grades, but mill culls and box are less plentiful. Notwithstanding that these latter grades have declined but little in comparison with the better qualities, they are likely, if present indications count for anything, to be the first to be advanced in price.

The lath situation has become interesting. No. 1 pine has been bought up quite heavily and there is very little in the hands of manufacturers. The mill price in Western Ontario is now about $2.70, and predictions have been made that this figure will appear very low when compared with the price which is likely to be reached before next spring.

QUEBEC AND NEW BRUNSWICK.

While the spruce lumber market is quiet, the tone continues strong when compared with the conditions which prevailed during the summer months. There is a good demand for specifications suitable for the American market, where certain kinds of narrow dimension stuff are commanding a premium. Clapboards, which have been dragging all season, are now holding their own a little better, and it would not take a very active buying movement to advance prices.

New Brunswick cedar shingles are gradually getting into a stronger position. The product is sold up pretty close to the saws on every grade except Extras, which are now firm at $3.20 to $3.25 for Boston delivery. Clears are very scarce and easily bring $2.80. It is estimated that the cut of the winter mills will be below the average and the tendency of prices during the next three months should be towards a higher basis.

UNITED STATES.

A moderate degree of strength continues to pervade the lumber market of the United States. Last week the Mississippi Valley Lumbermen's Association adopted a new price list making an advance on several items, including piece stuff and timbers, No. 1, No. 2 and No. 4 boards and lath. The quantity of lumber on hand is comparatively small, notwithstanding that the season has been favorable for manufacturing. The bulk of the white pine lumber is now in the hands of wholesale dealers, and they are not likely to make any price concessions. The Eastern States retail dealers are stocking up in some quantity. Box grades continue to have the call, while shop and better is reported slow. At Buffalo and Tonawanda prices are slightly irregular, the entire range of the leading grades of pine being given as follows: Uppers, $80 to $90; selects, $68 to $85; fine common, $53 to $80; No. 1 cuts, $38 to $72; No. 2 cuts, $25 to $55; No. 3 cuts, $21 to $27; No. 1 mouldings, $50 to $52; No. 1 dressing, $28 to $45; No. 1 barn, $24.50 to $33; No. 2 barn, $21 to $27; No. 3 barn, $18 to $24; box, $16 to $25; No. 2 box, $17.

The price of spruce frames are stronger and only a few mills are selling as low as the list, which is $19 for 9 inch and under

and $21 for over. Random is still offering at Boston at $17 for 2 x 3 to 2 x 7, and $18 for 2 x 8 and 9. Hardwoods are not much changed since last writing. Basswood is moving a little more freely, but prices are still easy. Birch is in good request.

GREAT BRITAIN.

Confidence in the British lumber market is gradually being restored. Business is improving and prices in most instances are hardening. Dealers who have held off buying are coming to the conclusion that they allowed their opportunity to pass and are now coming into the market at current prices. The improvement is very gradual, as might be expected, but before next spring there is likely to be a considerable advance in most lines. Spruce prices are firm at about £6 15s. per standard for St. John parcels. The results at the late auction sales have been more satisfactory. A quantity of 3 × 9 first, second and third quality Wolfe River spruce, in long lengths, brought £8 10s. per standard and some 3 x 8 unassorted Quebec regulars £7 10s., 2½ × 7 from the same port bringing £7 15s. Hardwood planks and deals sold at £7 10s., which is considered an excellent result and due to the small stock on hand. Shippers should remember that this is a retail quotation. Nevertheless, there has been a substantial recovery in birch planks, as is shown by the following extract from the Timber News, London, England: We have advised in our report from time to time that hardwood planks were bound to increase in price. The proof of the correctness of the advice is that about three months ago the ex quay price of Halifax stock was about £6, 15s. to £7. The latest sale for similar stock is over £8, and shippers are asking higher prices, for early shipment and will no doubt realize their anticipations, as the advices from the other side are to the effect that stock for immediate shipment is very scarce.

STOCKS AND PRICES.

The St. Anthony Lumber Company, of Whitney, Ont., will take out about 40,000,000 feet of logs during the coming winter.

Cameron & Company, wholesale lumber dealers, Ottawa, have on hand for immediate shipment a large block of good white pine sidings and shorts, also a quantity of birch and basswood in all thicknesses.

During the past month 2,000,000 feet of deals for the Liverpool market were shipped from R. & T. Ritchie's yards at Aylmer, Que. They have a quantity of logs in their pond and will operate their mill as late as possible. They carried on logging operations all summer on their Mountain limits.

J. A. Cody has decided to clear up his bush about two miles from Newmarket, Ont. He expects to have 150,000 feet of maple, beech, and elm, which has been contracted for, and 70,000 feet of hemlock, which will be cut into inch boards for sale.

The saw mills at Three Rivers, Que., cut about 75,000,000 feet of lumber during the past season. The mills located at this point are owned by Alex. Baptiste, Great Falls Lumber Company, Burrill Lumber Company and Union Bag & Paper Company.

Buffalo quotations for slack cooperage stock remain at $10.25 to $10.75 for first-class flour barrel staves, 7 to 7½ cents for first-class basswood heading, and $9.50 to $10 for 6-foot coiled hoops.

Hemlock is selling in Michigan at $12 for piece stuff and $13 for boards.

G. Keddy and Albert Zwicker, of Mahone, N.S., have purchased the timber of the Cook property near Bridgewater, and will establish a saw mill there.

The first steamer ever loaded with lumber at Portland for the Argentine Republic is about to sail. It is the Osceola and will carry 700,000 feet of Canadian spruce.

Some millmen figure that 25 per cent. of the No. 3 and better pine to be cut at Duluth next season has been contracted for. The lower grades for next year are astonishingly well sold out.

TO HOLDERS OF BIRCH LIMITS.

Can you cut birch into Squares, etc. We can also take birch cut on the sweep with a jigger or small band saw. Large quantities required. Write in first instance to "Finance," care CANADA LUMBERMAN.

LATH PRODUCTION AND DEMAND.

At the present time the demand for white pine lath exceeds the supply and prices are largely controlled by the seller. The supply of lath at the Lake Superior mills, throughout Michigan and in the Georgian Bay district has almost entirely passed out of first hands. Commenting on the situation, the American Lumberman says:

All the manufacturers along the lakes have sold out their stocks of lath. The wholesale and retail dealers now have all the lath in sight and they hold but a small percentage of the demand. In such a situation where is the supply to come from for the residue of the season? and where are the stocks for the late winter and early spring trade?

Prices of lath are now a consideration of less importance than is the ability to obtain lath at all. Holders of what lath there are can about make their own prices and the response will be prompt.

The interesting question arises, What has caused this season's scarcity of lath in the Michigan markets as well as in the entire middle west and eastward? Undoubtedly the decline of northern pine manufacture and the demand for box and crating lumber which has induced the use of as much of the log as possible for such purposes. To these causes must be added the extraordinary consumption of lath this year as a result of extensive building operations.

As the production of strictly white pine, as distinct from norway pine, diminishes, white pine lath become also a diminishing quantity. This shrinkage in volume is accentuated by economies in manufacture, which results in the use of all possible material in the log for purposes other than conversion into lath. Time was when the log was literally slabbed and the slabs were converted into lath to a large extent. Now the slabs are made as thin as possible and these slabs are resawed into box and crate stuff, or into any form that renders it usable. This reduces the percentage of lath that results from the conversion of the log. What is true of white pine is equally so of norway. Hemlock production has increased within recent years, and hemlock lath are in high favor wherever their merit is known. But there are wide sections in the prairie states in which hemlock lath are in disfavor simply because consumers are unused to them. Prices of good hemlock lath are about on a par with those of white pine. The production of hemlock lath has not yet attained sufficient magnitude to make good for the decline in the output of pine lath, nor is it likely to.

It should be observed that the scarcity of lath has arisen in the face of the use of a variety of metal and other kinds of lath. For ordinary building purposes nothing seems to have displaced the lath that is turned out by the saw mills. This is because wood lath is the cheapest ceiling material that can be found, no matter how high prices may go. So it seems that so long as the saw mills shall run and their lath machine adjuncts shall continue in operation there will be a demand for their product, even at prices that would have been deemed excessive a few years ago.

In view of the fact that lath stocks this fall are about cleaned up, and stocks during the winter cannot much accumulate, it looks as if the lucky holder of good supplies at present stands to make a good profit on them.

Redwood	24	1,400
Gumwood	14	960
Spruce	3	120
Total	66,764	3,258,448

ROCK ELM PRICES.

TORONTO, November 29, 1904.

Editor CANADA LUMBERMAN :

DEAR SIR,—In your issue of November 16th, referring to trade in Great Britain, you state, "Of the hardwoods Rock Elm is particularly strong. The stock is light and it has been found comparatively easy to advance prices, which now stand at 3s. 6d. to 3s. 7d. per cubic foot."

We are afraid that this will give millmen the idea that this can be obtained for the ordinary run of stock, whereas we find it difficult to secure more than $50.00 for 1sts and 2nds. Of course, we can readily understand that you refer to Rock Elm timber in long lengths.

Yours truly,
C. S. POWELL & Co.

LOGGING CONDITIONS IN NEW BRUNSWICK.

The fall rains on the Upper St. John river have worked against the lumbermen in their operations. They have made heavy muddy roads and the hauling of supplies has been done with difficulty and attended with unusual expense. The ground, however, is now frozen and covered with about two inches of snow, and the work is going along easily and more satisfactorily. The cut this year, as stated in an earlier issue, will not be more than one-half of that of last season. On the Upper St. John John Kilburn, for instance, will not get out more than 2,000,000 feet of spruce ; John Morrison will cut 3,000,000 of cedar ; W. J. Noble will take out 6,000,000 to 7,000,000 for Cushing ; Cunliffe will cut 5,000,000 for W. H. Murray on the Allegash. The Scott Bros. will take about 9,000,000 from the St. John. Four millions of this are J. McConnell's old logs now on the yards on the Wildcat, where they will cut another million and a half ; 1,600,000 will come from the New Brunswick Railway Co.'s lands and 60c,000 from lands some miles above the city ; the balance from other districts along the St. John. On the Magaguadavic Scott Bros. will cut a million, bringing the total operations for the season up to 10,000,000.

On the Allegash the work will be pushed along with activity. On this section the cut will be proportionately larger than in other districts of the St. John area, the output being principally for the Van Buren mills. For this concern Potts will cut 2,000,000, Chainard 2,000,000, McChaine 5,000,000, and Robert Aiken, operating on the same river, will cut 3,000,000 for Stetson, Cutler & Co.

The lumber cut on the Miramichi will also be reduced to about half of last year's, which was between 85,000,000 and 90,000,000 on the North and the South West.

BRITISH COLUMBIA LETTER.

(Correspondence of the CANADA LUMBERMAN.

VANCOUVER, B. C., November 21st, 1904.—Lumbermen in Vancouver are more hopeful in regard to conditions than they have been. The trade with the Northwest Territories has been better than was expected, and since the American mills have got rid of most of their surplus stock the dumping at slaughter prices may not continue much longer. Still there are evidences of depression, and the fourth of the smaller mills is in the hands of the sheriff for the satisfaction of creditors. Were conditions good, thes e could have pulled through.

There is talk of the federal member for Vancouver moving for the appointment of a commission to enquire into the conditions affecting the lumber industry in British Columbia. Anyway, he has promised to continue the fight for a duty of $2 per thousand feet of lumber imported from the United States.

American manufacturers dislike to acknowledge that British Columbia shingles are better in quality than those manufactured south of the line, and even state there is no foundation to such a statement. Notwithstanding, Mr. H. S. Stine, representing Barnes & Mauk, of Toledo, Ohio, who was in the city recently and who spent ten days investigating the shingle industry of the province, contracted for the output of two mills, besides securing a lot for immediate delivery. He said the timber was better, and while the shingles might not be better sawed, they were better packed.

Local millmen are strongly of the opinion now that price slashing should be stopped, and there is talk of a new price list being issued early in January. Twenty-five per cent. off the list price is the discount now obtaining, instead of 10 per cent. as formerly, and it is stated that in instances it is even lower. The owners of shingle mills are considering the adoption of some plan for their common welfare, the market in that line suffering from over-production.

Logs are beginning to get dearer, the figures having advanced from $3.50 to $5 per thousand to $5 to $8 per thousand. The small logger may again do business, and those who bought up large quantities some time ago will realize.

There is talk locally of Japanese capital being interested by Japaese for the manufacture of lumber for export to Corea and Manchuria as soon as the war is over. The market will be a virgin one, and the Japanese think they are in a better position than anyone else to engage in the trade. They do not think the depression will affect them.

Michigan capitalists, represented by Daniel F. Atland, have paid spot cash for 600,000,000 feet of fine timber, easily accessible, on Toba Inlet. They purpose erecting a large mill and engaging in the business with the eastern American cities which will follow the opening of the Panama canal. They also have contracts in connection with the construction. This deal had been ending since last spring.

The Kamloops Lumber Company are re-building their mill at a cost of $75,000.

The Mundy Lumber Company, of Bradford, Pa., will erect a large mill at Three Valley Lake, near Revelstoke.

The Canadian Timber and Sawmills, Limited, will pay 80 cents on the dollar. A public meeting held in Trout Lake City decided to ask the Government to cancel the licenses held by the company unless all wages were paid immediately.

CANADIAN LUMBER SHIPMENTS.

From St. John, N. B.: Schooner John C. Gregory, for Fort de France, 160,150 ft. pine boards. Schooner John C. Gregory, for St. Lucia, 190,470 ft. boards, 11 spruce spars. WOOD PULP DEPARTMENT

FIRST PAPER MILL IN ONTARIO.

Mr. V. H. Hickox, of Niagara Falls, tells of the first paper mill in Ontario. He says :—

"It was in the summer of 1841 that my father and another paper maker, whose name was Samuel Prine, engaged to go to Toronto and start the first paper mill in Upper Canada. They left Niagara Falls in June of that year. This mill was located about three miles from the city, up the River Don, a beautiful clear stream of water, well supplied with trout and other kinds of fish in abundance. The country round about was a vast wilderness of heavy timber, mostly pine, with here and there a little clearing with log cabin homes of the early pioneers.

"Eastwood and Skinner, brothers-in-law, two enterprising Englishmen, built the first mill and received a cash premium from the Canadian Government. In connection with the paper mill there was a grist mill, a brewery and distillery, owned by the Helliwell Brothers, and the place was named Don Mills.

"My father made a sojourn of seven years, during which time he started a second paper mill on the Don River, two miles above the first mill. We moved to Hamburg, west of Buffalo, about 1848. In the year 1851 Albert H. Porter sold the paper mill on Bath Island, and my father, by this change, secured his old position as superintendent of the upper Don paper mills. Then he moved back to Toronto in 1851, where he remained for many years, respected as the man who made the first sheet of paper in the upper province of Canada."

BLEACHING GROUND WOOD.

The yellowish color of ground wood fibres varies according to the quality of the wood and purity of water in mixture of reddish, brownish and gray shades; but these conditions were of small significance so long as ground wood was only used in small proportions with better stock, says "Sylvanus" in Der Papier Fabrikant.

An addition of a red or blue aniline color or a violet will present the impression of a white shade to the unexercised eye, while in fact the shade is really reddish or greenish. A comparison of news and mixed book stock with bleached writing or with white linen or cotton stock will readily tend to prove the great difference in the shade of snow white and ground wood white.

During late years advancing prices have caused a cut in the manufacturing profits and developed a natural desire to economize by introducing the cheaper grades of raw materials on a more extended scale for the making of the grades above news, such as the medium writing and printing qualities.

The yellow shade of the ground wood proved a disturbing feature, and there arose the necessity of overcoming the well known difficulties in the bleaching of ground wood. Many processes have been gradually "invented," but they proved costly, troublesome and without adequate result.

As a means for at least improving the shade of ground wood, sulphurous acid alone, in its diluted form or in bisulphite of sodium or bisulphurous sodium, has proved of economical usefulness.

The idea of imparting a white shade to ground wood was derived from the old process of bleaching straw pulp, known before wood pulp was ground. The bleaching process may be briefly described as follows : Sulphur is burned in an oven for producing a sulphurous gas, the SO_2, the same that is used in the boiling of sulphite pulp in the known digesters (in its combination with lime forming calcium bisulphite). The SO_2 gas is introduced through suitable channels into, or rather under, the lower part of a tank provided with a perforated bottom, and also with slowly moving agitator blades, that tend to keep the gradually introduced parts of loose ground wood moving over the perforated inlets for the gas. An aperture is provided to allow the agitator arms to discharge the product, which is collected in a pile or in bags, where its color gradually improves. Experience must teach the time required for producing the best results. Naturally the tank must be closed and provided with an outlet for the gas into the higher regions out of harm's reach.

In case the pulp is to be bleached in the shape of loose rolls, a well closed compartment, perfectly constructed of brick or stone, provided with openings for ingress and exit of hands, gas and ventilation, may be the most advisable. In order to prevent the effect of the noxious gases any small opening should be temporarily hermetically closed by pasting strips of paper over the same. The rolls of pulp should be placed separately on strips of wood to allow the passage of the gases between the surface of the web and to proceed upwardly into the open air.

Another process for bleaching wood pulp by the influence of sulphurous acid is performed by soaking the stuff with solutions of bisulphite of sodium in large tanks and also in this case the rolls should be separately placed on end to allow the solution to pass between the layers.

The quantity of bleach required depends largely on the quality, age and other conditions of the wood, and it is therefore advisable to make several trials in order to reach the desired object. Every contact of iron with the solution, producing a black discoloration, must be carefully avoided. The last described process is the more expensive and causes additional labor. The weight should be ascertained before bleaching. However, in the latter process the appearance of free acid is entirely avoided.

PULP NOTES.

The Chatham Pulp & Paper Company, Limited, of Lachute Mills, Que., has been incorporated.

The Paper Trade Journal says that Francis H. Clergue and other capitalists, some of whom are residents of Detroit, are planning to erect one of the biggest paper mills in the country a few miles below Sault Ste. Marie, Mich.

The Imperial Paper Mills Company, of Sturgeon Falls, Ont., are building a new wood room much larger than the one recently destroyed by fire. The boiler room has been enlarged to accommodate another horizontal tubular boiler.

The Newfoundland Timber Estates Company are announced to have disposed of their timber areas in Newfoundland to Sir Alfred Harmsworth, the well-known publisher of London, England. The price is given as $2,000,000.

Mr. Charles W. Rantoul, jr., formerly with the Imperial Paper Mills, of Sturgeon Falls, Ont., has opened an office at 41 Park Row, New York, under the name of the C. W. Rantoul Company, Incorporated. The company will act as a selling agency for paper mills.

The members of the survey party sent out by the Quatsino Power & Pulp Company, of Vancouver, B.C., have completed their work for the season. The party numbered thirty-six. The investigations made prove that the company have valuable timber areas. The water power available has been estimated by Mr. Colby, of Boston, at 14,000 horse power, which will permit the company to operate on a large scale. The pulp mill have been completed and plans for the paper mill are being prepared. The construction of pulp mill and a saw mill will be commenced in January next.

The Nassau Paper & Pulp Company, of East Peperell, Mass., are reported to have purchased the pulp mill at Chatham, N.B., formerly operated by the Maritime Sulphite Fibre Company, but which has recently been in the hands of the Bank of Montreal. The purchasers will manufacture sulphite pulp for their mill at East Peperell. Contracts are now being placed for the cutting of pulp wood during the coming winter and the citizens of Chatham are looking forward with anxiety to the time when the mill will resume operations.

Large quantities of spruce and poplar are being forwarded to American mills from points in the Pontiac and Gatineau districts above Ottawa. This season the firm of McFarlane Bros., of Campbell's Bay, shipped 2,000 cords. This winter they expect to contract with jobbers for the cutting of 7,000 cords, mostly poplar and basswood. Next year it is expected that the Canadian Pacific Railway Company will build an extension in the Pontiac country, which will make marketable large areas of poplar and basswood suitable for pulp making.

F. H. Todd & Sons, of St. Stephen, N. B., are said to have completed arrangements with New York capitalists for the establishment of large pulp and paper mills on the St. Croix river. They have disposed of their timber holdings to the St. Croix Pulp & Paper Company, recently organized, with a capital of $2,500,000 and headquarters at Calais, Maine. Frank Todd is president of the new company, and I. B. Hosford vice-president and general manager. The company will require only the spruce growth upon their area, and Todd & Sons have secured the first option on the pine timber, a provision which will enable them to operate their saw mills as at present.

WHEN THE COOK CALLS.

There's a merry response when the cook shouts **Clark's Corned Beef** for dinner. **Clark's** is made of prime Canadian beef by **William Clark, Montreal,** and retains all the good qualities.

Paper, Pulp and Sulphite Fibre Mills

THE NEWS

ONTARIO.

—Alex. Mustard is rebuilding his saw mill at Bayfield, Ont.

—George Weaver is building a saw mill at Coldwater, Ont.

—Church & Bro., of New York, are starting a heading and stave mill at Orillia, Ont.

—New planing mills have been built at New Hamburg, Ont., by J. J. Berger and J. Forle.

—Ford & Greer, whose saw mill at Stoneleigh, Ont., was burned down recently, are rebuilding.

—David Gordon intends installing a shingle mill in connection with his saw mill at Dayton, Ont.

—Leuck Bros. are building a saw mill on the 2ud concession of Holland Township, near Owen Sound, Ont.

—The Nipissing Lumber Company, Limited, have been authorized to increase their capital stock from $40,000 to $125,000.

—Mr. Wayper, of Hespeler, Ont., has purchased 400 acres of timber land near South River, and is building a large saw mill.

—The will of the late Alexander Lumsden, lumberman, of Ottawa, showed an estate of $935,042, all of which is bequeathed to Mrs. Lumsden.

—The Davidson Lumber Company are now engaged in the construction of their new saw mill and logging railway. The mill will be located at Springfield Lake, N. S.

—Philip Ament is rebuilding his planing mill at Brussels, Ont., utilizing the old foundation. The new building will be of cement, two stories, 50 x 75 feet, with a dry kiln 25 x 50 feet.

—The Edmund Hall Estate has paid $37,000 to the Ontario Government as succession dues. Mr. Hall owned saw mills at Sarnia, Ont., and had extensive timber limits on the Spanish river.

—P. Sawyers, of Guelph, Ont., has sold his stave mill and fifty acres of pine timber to George McAllister, of the Guelph Saw Mills. Mr. Sayers will confine his attention to the mill at Nassagaweya.

—Alfred Bordeau, an employe of Pincombe & Donaldson's saw mill at Strathroy, Ont., lost his left arm by having it caught between the chain and the pulley while engaged in hauling logs from the yard to the mill.

—Moses & Son, of Carp, intend building a mill at Farrelton for the manufacture of cheese and apple box veneer, in addition to the usual custom work. This will make four mills operated by this firm, the other three being located at Carp, Vernon and Osgoode.

—The Rider & Kitchener Company, of Lindsay, Ont., are installing a plant for the manufacture of brush handles, blocks, and turned goods. This will be operated in connection with their present veneer and excelsior business. The new plant is expected to be in operation about the middle of December.

—A reorganization of the Ontario Bureau of Forestry and Colonization has taken place. The provincial parks, which heretofore have been in charge of the Bureau of Mines, will hereafter be under the control of Mr. Thomas Southworth, as Chief of the Bureau of Colonization, Forestry and Parks.

—Incorporation has been granted to the Leeds Lumber & Power Company, Limited, of Brockville, Ont., the directors being J. G. Gardner, F. B. Cossitt, C. T. Wilkinson, A. G. Bowie and R. A. Bowie. It is proposed to acquire timber limits and conduct a general lumber business. The capital is $40,000.

—Robert Stewart, Limited, of Guelph, Ont., have recently installed a new Woods (Boston) flooring machine, which they say is giving good satisfaction. They contemplate enlarging their mill and installing another large dry kiln especially for hardwood flooring. This firm are handling large quantities of southern oak, cypress and yellow pine.

—A joint stock company has recently been formed under the name of the Muskoka Lakes Milling & Supply Company, Limited. They propose to purchase the saw mill property situated at Rosseau Falls, Muskoka, from P. Mutchenbacker, and expect to turn over a stock of two and one half million feet of pine and hemlock during the season of 1905, a considerable quantity of which will be manufactured into all kinds of dressed stuff.

—The Carney Lumber Company, who are about to build a saw mill in Owen Sound, Ont., advise us that it will be a two band and gang mill, with dry kilns in connection, and that they expect to have it in operation by July 1st, 1905. They will build docks for water shipping and will have considerable tramways in their yard where lumber will be piled for rail shipment. They are logging 15,000,000 feet this winter to be manufactured in Owen Sound next year. After next year they expect to manufacture about 20,000,000 feet each season and to employ 200 men.

THE EASTERN PROVINCES.

—Sayre & Holly have completed their new saw mill at Chipman, N. B.

—A. F. Bentley has sold his saw mill at Loggieville, N.B., to A. & R. Loggie.

—The lumber and produce firm of L. & F. Tufts, St. John, N. B., has been dissolved.

—Leblanc & Company have sold their sash and door factory at St. Leonard, Nicolet County, Que., to Ambrose Champagne.

—Hercule Dupre and Arthur E. Beaupre have registered as proprietors of the saw mill business of H. Dupre & Company, Portneuf, Que.

—The business of Adams, Burns & Company, of Bathurst, N.B., will hereafter be conducted by a joint stock company, under the name of the Adams, Burns Company, Limited. The capital is $175,000.

—The Rosebank Lumber Company, of Rosebank, N.B., has been incorporated, with a capital of $75,000, the promoters being O. W. Norden, Knup Norden, Axel. M. Sundon, Pedee C. Waern and Carl F. Neisson. It is the intention of the company to erect a large saw mill to manufacture articles not hitherto made on the Miramichi river.

—The East Templeton Lumber Company, Limited, of Brockville, Ont., has been incorporated, to acquire the business heretofore carried on at East Templeton, Que., and elsewhere by the late John MacLaren. The capital stock is $300,000 and the incorporators include W. C. MacLaren, of Brockville, Ont., and John E. Vallillee, of Buckingham, Que.

MANITOBA AND THE TERRITORIES.

—The Macoun Lumber & Hardware Company, Macoun, N.W.T., has been dissolved.

—The Great Northern Lumber Company, Limited, has been incorporated at Kamsack, N.W.T.

—The Calgary Lumber & Manufacturing Company, Limited, has been incorporated at Calgary N. W. T.

—The lumber business of James McDole, Cypress River, Man., has been purchased by Thomas Millard.

—R. J. Arbuthnot, lumber and hardware merchant, Minto, Man., is closing out his business and moving to Winnipeg.

—The Rat Portage Lumber Company are now at work on the erection of their sash and door factory at Norwood, Winnipeg.

—Lawrie & Williams, retail lumber, Moose Jaw, N.W.T., have dissolved, and a new company has been formed by J. A. Laurie.

—The Western Trading Company, of Abernethy, N. W. T., have sold their lumber business to the Gibson Lumber Company, Limited.

—The Cusson Lumber Company, of Winnipeg, have leased six acres of land near the the Seine river, where it proposed to establish a factory.

—The firm of Morkill & Bayly, wholesale lumber merchants, Winnipeg, Man., has been dissolved and the business will be continued by Mr. Bayly.

—J. A. McTaggart has started in the hardware and lumber business at St. Peter's and Humboldt, N.W.T., two towns on the Canadian Northern Railway.

—The Rushton Lumber, Grain & Supply Company, Limited, has been organized at Wetaskiwin, N. W. T., with the intention of opening branches in new towns on the branch railroad.

—The Regina Planing Mill & Supply Company, recently granted a bonus by the city of Regina, N.W.T., have commenced work on their planing mill, which will be a two-storey structure equipped with modern machinery.

—Christie & Company, Limited, have been incorporated as lumber merchants at Winnipeg, Man., with a capital of $40,000. The members include John A. Christie and John Dick, lumber merchants, of Winni-

CRAIG MINE CRYSTAL CORUNDUM WHEELS

Our Pure Crystal Corundum Saw Gummers have no equal for their Rapid, Cool, Cutting Properties.

Read the following from Bulletin 180 of the United States Geological Survey, which says :

"Often a distinction is made between emery and corundum, many persons not recognizing emery as a variety of corundum.

Emery is a mechanical admixture of corundum and magnetite or hematite. It is, of course, the presence of corundum in the emery that gives to it its abrasive qualities and makes it of commercial value, and the abrasive efficiency of emeries varies according to the percentage of corundum they contain."

Emery is imported, mined by Greeks and Turks and contains only about 25% corundum. Our Crystal Corundum is guaranteed to be 98% pure alumina, a Canadian product, mined and manufactured by Canadians for Canadians.

BRITISH COLUMBIA.

—John Jackson, a well-known logger of Vancouver, B.C., was drowned at Malespina Inlet by the upsetting of a boat.

—C. F. Wilson has applied for a lease of property on False Creek, Vancouver, B. C., for the operation of a small saw mill.

—Small & Bucklin, a lumber firm formerly of Ithaca, N. Y., purpose building a saw and planing mill at New Westminster, B. C.

—The Elk Lumber & Manufacturing Company, of Fernie, B. C., purpose making improvements on the Elk river for logging purposes.

—Pearson & Jewel give notice of proposed improvements to Little Sand and McBayne creeks, East Kootenay, B. C., for logging purposes.

—The Fernie Lumber Company, of Fernie, B.C., have established a lumber yard at Calgary, N.W.T., which will be in charge of W. McKinnon.

—The Victoria Lumber & Manufacturing Company, of Victoria, B. C., intend making improvements to the Tsolum and Courtenay rivers for logging purposes.

—The British Columbia Manufacturiug Company, of New Westminster, B. C., are turning out some fine qualities of veneer, for which they are finding a large demand.

—The McNab Lumber Company have established a mill at Fort Steele Junction, B.C., for the purpose of cutting some timber which was damaged by fire during the past summer.

—The Capilano Lumber Company, of Vancouver, B.C., are building a new saw mill, also a large flume from a point above the waterworks dam at the Inlet front, the latter to be used for the floating of logs to the mill.

—It is reported that, after a visit to British Columbia and an investigation of lumbering conditions, the directors of the Ontario-Slocan Lumber Company have decided not to increase the producing capacity of their mill at Slocan, B.C., at the present time.

—The British Columbia Mills, Timber & Trading Company, of Vancouver, B.C., was awarded the first gold medal ever struck by the Royal Agricultural and Industrial Society of New Westminster, B.C. The prize was given for their display of "ready made" houses.

—The Cranbrook Sash & Door Company, Cranbrook, B.C., has been reorganized under the name of the Kimberley Milling & Manufacturing Company, the partnership now consisting of H. A. McCowan, Albert Slater, A. S. Nicholson, J. H. Spence and William Slater.

—The Barclay Sound Cedar Company, Limited, has been incorporated by the British Columbia Government, with a capital of $50,000, to carry on a general logging and lumbering business. The Windermere Lumber Company, Limited, has also been incorporated at Victoria, B. C., with a capital of $20,000.

—The Royal Lumber Company, which was recently incorporated by the British Columbia Government, is the name by which the McGoldrick Syndicate will hereafter be known. The company contemplate extensive operations in the Nelson district. The principal shareholders are J. P. McGoldrick, T. A. Lammers, and the Eastside Lumber Company, of Stillwater, Minn.

—The Elk Lumber & Manufacturing Company have placed contracts for the machinery for their new mill now under construction at Fernie, B.C. The mill will have a capacity of 125,000 feet in ten hours. The power will be furnished by six boilers and four engines and there will be a double cutting band mill. An electric light plant will also be installed, the intention being to make the new plant complete and modern in every respect.

—J. A. McArthur, Alfred Campbell and Michael Purtell, of Sussex, N.B., and James Smith and James W. McAfee, of Millstream, N.B., have formed a company to carry on lumbering operations in British Columbia. Mr. Purtell recently went to Cranbrook to survey 8,000 acres in that vicinity, on which there is said to be 60,000,000 feet of timber. It is understood that for the present operations will be conducted with a portable mill.

—E. F. Ferris, of Traverse City, Mich., has been in British Columbia recently for the purpose of looking into the lumber business. He claims to represent capitalists who are willing to invest about $300,000 in acquiring timber limits and building a saw mill. Surveyors on their behalf are now cruising 10,000 acres of timber lands on both sides of the North Thompson river, which consist principally of cedar. It is proposed to bring the logs 150 miles down the river to Kamloops, which is believed to be entirely feasible.

—The Kamloops Lumber Company are making good progress with the erection of a new saw mill at Kamloops, B.C., to replace the one destroyed by fire in December last. The main building will be 136 × 30 feet, with a planer shed on the west side 60 × 60 feet. It will be a frame structure with sheet iron roof. The Waterous Engine Works Company, of Brantford, Ont., will supply most of the equipment, which will include a steam log roller, steam nigger, automatic lumber transfers, a slash table having 16 saws, heavy lumber planer, moulder, sticker, flooring machine and resaw. There will be two 125 h.p. engines and a battery of three boilers. The plant will cost about $75,000 and the output will be 20,000,000 feet per annum, about double the capacity of the former plant. Manager George McCormick states that the mill will be completed by April next and that the monthly pay roll will be $10,000.

It is announced that Mr. Samuel McBride, a well-known wholesale lumber dealer, and one of the directors of the Toronto Industrial Exhibition, will be a candidate for Alderman in Ward 3 at the approaching elections.

PERSONAL.

We regret to learn of the death of Mr. Herman J. Kreinheder, of the Standard Lumber Company, Buffalo, which took place on October 29th.

Mr. William N. Sawyer, of the firm of Wellman Sawyer & Morgan, Pittsburg, has been appointed general manager of the Consolidated Lake Superior Company, of Sault Ste Marie, Ont., as successor to the late Cornelius Shields.

The death is announced of Mr. E.B. Ketchum, manager of the Lawton Saw Works, St. John, N.B., at the age seventy-three. In his earlier life Mr. Ketchum was a master mariner, subsequently engaging in general business and becoming interested in mining and manufacturing.

Mr. Alexander Hamilton died at his residence, 659 Lansdowne Ave., Toronto, last month as a result of an accident. Mr. Hamilton entered the service of the C. P. R. as lumber inspector in 1888, a position from which he retired with a pension last summer. He was born in Peebles, Scotland, in 1836, and came to Canada fifty years, settling at Atwood, Perth county.

Mr. John Lummis, of Wyebridge, Ont., died last month as the result of injuries received by being thrown out of a buggy. Deceased was born in Yorkshire, England, coming to Canada with his parents when six years of age and settling in Quebec. He afterwards lived near Lindsay, Ont., and later removed to Wyebridge, where for years he has conducted a successful lumbering and flour milling business.

Some important changes on the Canadian division of the Pere Marquette Railway have been announced. General Superintendent William Woollatt, with headquarters at Walkerville, Ont., has resigned on account of ill-health and has been succeeded by J. S. Pyeatt, who has been assistant to General Manager Cotter at Detroit and also Superintendent of Telegraphs. H. O. Halstead, of Detroit, succeeds Mr. Pyeatt.

Mr. Charles F. MacGill, long and favorably known as mechanical superintendent of the Canadian General Electric Company at Peterboro and the Canada Foundry Company at Toronto, has accepted the position of general superintendent of Carrier, Laine & Company, Levis, Que. Mr. MacGill has been in Canada about six years, and previously was connected with some of the best concerns in the United States, notably the General Electric Company and the Westinghouse Company.

Mr. J. Remonda, of the firm of Remonda, Monseratt & Company, of Rosaria de Santa Fe, Argentine Republic, was a visitor to Canada last month. His firm are large importers of spruce lumber and the object of his visit was to investigate the lumber industry with reference to the methods of manufacture, extent of supply and shipping facilities. Mr. Remonda visited the white pine and spruce districts and is said to have purchased considerable lumber. He remarked that the Canadian lumbermen did not give as much attention to the details of manufacture as did the Norwegians and Swedes, with the result that their lumber was less perfectly manufactured.

Wholesale Grocers - - TORONTO

BAND SAW CRACKS.

Having noticed inquiries as to the cause of both edge and center cracks, I will tell how I steer clear of them. Five years ago, where I am at present employed, edge and center cracks were an every day occurrence. The firm sent to New York City for an expert to locate the trouble. After looking the machine, saws and filing room equipment over, he told them what they wanted was a filer. When I came they had four saws, two of which had not been run for some time. They were full of center cracks from 1-8 inch to ¾-inch long, and saws not worn down ¼-inch yet. The other two saws were practically new, but there were two brazes in one saw and four in the other.

The first thing was to overhaul the machine and line up the wheels. I did not tip the upper wheel, as some filers do, but left it plumb with lower wheel. I think it bad practice to do so, and will try to make my reason clear. What is the sense of running a long-back saw and tipping upper wheel forward to take up the extra length in saw? There is nothing gained by that. You might better run a straight-back and leave the upper wheel alone. It takes some stretching to put the back in a saw, and if you tip upper wheel forward, the tooth edge of saw, while in the cut, will be the longer, which is the reverse of what you want to cut straight lumber. I always put up my saws with 1-8 inch back in 12 feet.

The next thing was the guide blocks. They were made of soft brass, and by the looks of the saws it seemed as if the sawyer had tried to hold the saws in the cut with the guides, as the saws were brass-plated where they run through the guides, and consequently crystallized. I substituted maple, not having lignum vitæ on hand. I always have an extra set of guide blocks soaking in oil, and don't use dry end wood, as some filers do.

The next operation was to get the saws in shape to cut lumber. Looking them over, I found the saws with the center cracks had the least tension and the edge-cracked saws the most. Some filers blame all center cracks to too much tension. Admitting it, yet I have seen saws run with so much tension that when lying on the bench they were all wavy, yet they did not center crack. My opinion is that more saws are center cracked from rubbing on the guides and having cross lumps in them than from any other causes.

I prick-punched all the cracks I could find and fitted the saws up as explained in a previous number of The Wood-Worker, then took off 600 pounds of straining weight, and was ready to make a run. I started the machine and watched all boxes, letting machine run light for a few minutes. Everything seemed right except a little vibration of machine, as there was no foundation under it, no is there yet. There was about 10,000 feet of white pine to be resawed, and after I got started sawing there wasn't a man about the place that did not come in to rubber, as I was feeding 105 feet of 1x12 pine. Getting another man to help take away, I finished the run, then looked over the saw and found I had a few new center cracks, but I expected that, as a saw that is crystallized will keep on cracking; the only way to stop it is to send it back to the factory and have it retempered. I made those saws go until I go four new ones. Since then the machine has made its two runs every working day and I have had but two cracks, and those in the braze. I attribute my success to never slighting my work and keeping my saws as nearly perfect as it is possible to have them.

In conclusion would say, don't use metal guides, but use wood well soaked in oil. Don't try to make the guides make up for poor saw filing, as a saw that is poorly put up won't stay in the cut, no matter how close the guides may be. Have the tension as even as possible, as a little tension evenly distributed is better than a lot unevenly put in. See that there are no "round-corners" on the teeth. See that the box nearest lower wheel fits snugly, as any jump there will crack a saw every time. And, above all, don't have any cross-bars in your saws; they are easily found by wiping the saw with kerosene oil and drawing straight-edge from tooth edge to back edge; every one will be marked. Take them out with long-face hammer. Don't try how quickly you can put up a saw, but how well. Go over your saws often; don't wait until they begin to dodge.

Use little clearance; a saw with little set will stand up better, cut smoother and use less power. Don't use the tilting device at all, and if you use the crossline, be careful; when you use that you are running your saw in a twist, and that is something to be avoided. I use neither crossline nor tilt, but put up all my saws alike, and when they begin to crowd back, I sharpen again. There are lots of saws broken by trying to make them cut five hours, whereas three would be better. I have found that saws will become crystallized on the back edge by bearing on the sharpener rest while sharpening, but that can be removed by holding a piece of emery wheel at back of saw while running.—John Holland, in The Wood-Worker.

PUBLICATIONS.

Cowan & Company, of Galt, Ont., have issued a very complete and interesting new catalogue of wood-working machinery.

A small booklet from R. Hoe & Company, New York City, tells how the Hoe chisel tooth saw is made and how it should be taken care of.

"Tangible Results" is the title of a booklet issued by the Waterous Engine Works Company, of Brantford, Ont., the main purpose of which is to show the economy and advantages of band saws.

Messrs. Graham, Morton & Company, engineers and contractors, Leeds, England, have issued a very attractive catalogue, No. 940, devoted to conveying plant for the handling of all classes of materials.

Mr. H. R. A. Baughman, of Indianapolis, Ind., has issued the seventh edition of "Baughman's Buyer and Seller," which has been enlarged and improved. The lumber tables show nearly nine thousand different sizes and lengths, and the number of feet in any number of pieces can be determined at a glance. The cost and interest tables are also a valuable feature of the book.

A. F. Bartlett & Company, of Saginaw, Mich., have issued a catalogue devoted to special saw mill machinery, including Bartlett-Corliss engines, deck hoists, twin engine rope feeds, saw mill hogs or edging grinders, etc. This company have a reputation for supplying the best machinery, their works being splendidly equipped for that purpose. They are prepared to make estimates on mills of any capacity.

Mr. D. Boyce Sprague, of the Sprague Lumber Company, Winnipeg, Man., has been appointed Hoo-Hoo Vicegerent for the Central District of Canada.

VARIETY TURNING AND BORING LATHE.

The illustration herewith represents the No. o Variety turning and boring lathe manufactured by the Defiance Machine Works, of Defiance, Ohio, for producing turned articles from wood. It is arranged to meet the most exacting requirements and will produce turned work sharp, clean and smooth, in either plain or beaded turning, and do the work so that no hand labor is required after leaving the machine. The material from which the work is turned is placed into the machine in short or long pieces, and is converted into the finished article, bored, turned, polished and cut off complete ready for use.

The frame of this machine is cast in one piece with cored centre and a broad floor base to stand firm. The top is accurately planed and scraped to bearing for the working parts.

The head spindle, of steel, runs in large bronze self-lubricating bearings, and it is driven by a three-step cone pulley, giving three changes of speed for small or large work. The front end of the spindle is fitted with a screw chuck to hold one end of material to be turned, the other end turning in the roughing head bush.

The cutterhead carriage is thoroughly gibbed to the top of the frame of the machine, and is provided with a horizontal movement by hand-wheel to move the cutters to where the turning shall begin. It also has a right angular movement by hand lever, to move the finishing knife to the work.

The roughing cutter is attached to the carriage immediately in advance of the finishing knife. It reduces the square material to the smallest diameter to which it will nicely finish. The cut-off attachment is also fitted to the carriage and travels with it. It stands in a vertical plane and is brought down to its work by a convenient hand-lever.

No. o VARIETY TURNING AND BORING LATHE.

The tail stock is gibbed and accurately fitted to the top of the frame, central with the head spindle. It is fitted with a large spindle to carry a boring bit to bore holes of different sizes. When work is intended to be bored, the boring is performed before the turning is accomplished, leaving the boring bit in the hole while turning, it acting as a steady rest. For doing work that requires no boring, a cup center is used in place of the bit. The tail spindle is brought up to or from its work by a convenient hand-wheel.

In operating this machine, the square material to be turned is placed into the chuck while the machine is in motion. No stoppage is necessary either to place in the rough material, or to take out the finished product. The material is first roughed by sliding the carriage forward in a horizontal plane a sufficient distance to suit the length of the article to be turned. The boring is then performed, after which the finishing knife is brought up to the work, which is shaped complete at one movement. The cut-off knife is then brought down by hand lever and the finished product is discharged from the machine, and so the work is continued until the material in the lathe is entirely consumed.

The capacity of this machine is sufficient to produce from 5,000 to 8,000 pieces per day, depending upon the size and shape of work and the quickness of the operator. It will turn irregular work eight inches long and shorter, but plain round work, such as rollers, pins, etc., can be turned up to 36" long, and from ⅛" to 3" diameter.

Toronto Canada.

We Can do the same for You

TORONTO, October 24th, 1904.

THE J. A. CRAIG LUBRICANT CO., Limited,
Toronto, Ont.

GENTLEMEN,—It is with great pleasure we testify as to the practical value of your Cylinder and Engine Oils, also your compounded greases, as your goods have certainly been a surprise to us.

We adopted your system of lubricating at our mills and on our boats at French River for the season of 1904 and on comparing this year's accounts to date we find you have reduced our oil and grease account to one half what it has been in former years, and this in the face of additional machinery recently installed and the output of our mills having been greatly increased.

Not once during the whole season have we been troubled with a hot journal, our first experience of this sort in years.

We have one man only to do the oiling for our entire plant and he appears to have an easy time.

So long as you continue to supply us with goods equal to what we have had from you this season, you can depend upon receiving all of our trade in this line.

You are at liberty to make use of this letter in whatever way you wish, as we really feel grateful for what you have done for us at our mills.

Yours truly,
THE ONTARIO LUMBER CO., Limited.
H. H. Cook, President.

BYNG INLET, AUGUST 13TH, 1904.

MR. J. A. CRAIG:

Dear Sir, or to whom it may concern,—I have been using your cylinder oil on our 600 horse Corliss Engine in our saw-mill as a test for the last three weeks and I can honestly say I can run on less oil than half and with better results than with any other oil I have ever tried, in fact the metal is so soft in this engine no kind of cylinder oil (Vacuum included) we could buy in Canada would do. The only oil we could use was Harris Oil imported from Boston, U. S. A.

The longest a one gallon lubricator of Harris Oil would run was seven hours, while your cylinder oil would run twenty-one hours with better results. I tried the oils in our other big Corliss with even better results, and as long as you compound your cylinder oils and have them as good as samples I shall use no other.

Your compression cup grease is excellent and your pure fat for enriching mineral oils makes everything run safe. I therefore highly recommend them.

Yours truly,
JAMES TATE,
Chief Engineer Holland & Graves Lumber Co.

If you have a saw mill in connection with your plant and you use the slabs as fuel, they can be dried easier or quicker if piled with the round or bark side down. Moisture follows the grain of the wood and drains out at once when piled this way. A gum slab piled round side down will rot out in a short time, even under cover, as the moisture is retained in the slab, the ends drying and closing the pores of the wood. On the other hand, when firing slabs under a boiler, they should be placed on the fire with the round side down, as they burn better in this position and offer less resistance to the flames.

Pitch-pine was introduced into France about the year 1869, and did not gain popularity so rapidly in that country as in England. Now, however, enormous quantities of this timber are used in France, and, owing to increased demand, the price for this wood is rising proportionately. The resin in pitch-pine is prevented from oozing out by smoking the trees immediately after felling, which hardens the resin and causes it to crystallize in the woody fibres.

THE DISTINGUISHING MARK

To install in your mill a set of saws that will suit you in every particular, it is necessary that you be familiar with some means of distinguishing the HIGH-CLASS SAWS from the others. Knowing some such mark you will always discriminate in favor of the saw which bears that mark of QUALITY.

THE ATKINS "TRIPLE A" etched on all HIGH GRADE SILVER STEEL CIRCULAR and BAND SAWS, is the sign which assures QUALITY, EXCELLENCY and absolute SUPERIORITY in Saws. "IF IT'S SILVER STEEL IT'S AN ATKINS." Look for our trade mark.

A little reminder of the "TRIPLE A" in the way of a pretty watch charm to Mill men who write for it. Also our Mill Supply Catalogue. Both free.

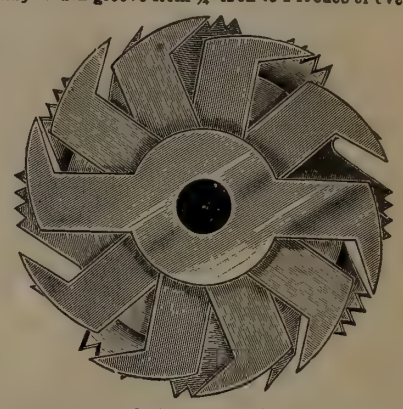
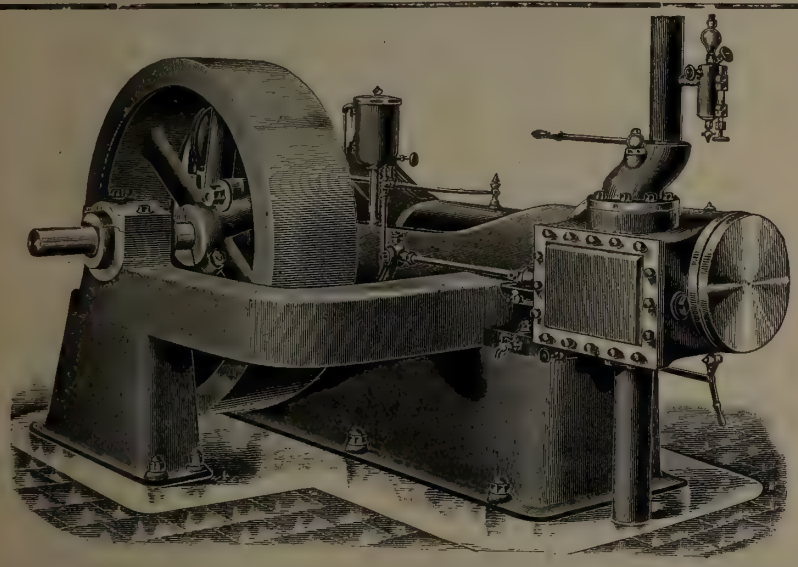
Can be used on any Circular Saw Mandrel.



Will cut a perfect groove with or across the grain.

This is the only Dado Head on the market that gives entire satisfaction on all classes of work. No screw adjustment. For different width grooves, simply remove or add inside cutters. Sold by builders and dealers of woodworking machinery in all parts of the United States. Will send on approval, in competition with any other make on the market; if not the best return at our expense. HUTHER BROS., Platt Street, ROCHESTER, N.Y., manufacturers of Circular Saws, Morgan Pattern Lock-Corner Box Cutters, Concave Saws, etc.



GIVES NO TROUBLE

A mill owner writes us: "The 16x16 Robb-Armstrong Automatic Engine installed in our saw mill in 1903 has proved very satisfactory. It has been running steadily five months each sawing season of 1903 and 1904 and has given us no trouble whatever. We drive with it a large rotary, lath mill, patent haul-up, complete sawdust conveyor throughout the mill, live rolls, trimmers, slab saws and planers. We do not have to develop its full power to do this work. The governor is very sensitive, there being only a variation of 3 per cent. when saw is running in and out of cut. We use steam feed to drive our rotary and put through the mill 750 to 800 logs per day."

Capital and Surlpus, $1,500,000.
Office Throughout the Civilised World.
Executive Offices:
Nos. 346 and 348 Broadway, NEW YORK CITY, U.S.A.

THE BRADSTREET COMPANY gathers information that reflects the financial condition and the controlling circumstances of every seeker of mercantile credit. Its business may be defined as of the merchants, by the merchants, for the merchants. In procuring, verifying and promulgating information, no effort is spared, and no reasonable expense considered too great, that the results may justify its claim as an authority on all matters affecting commercial affairs and mercantile credit. Its offices and connections have been steadily extended, and it furnishes information concerning mercantile persons throughout the civilized world.
Subscriptions are based on the service furnished, and are available only by reputable wholesale, jobbing and manufacturing concerns, and by responsible and worthy financial, judiciary and business corporations. Specific terms may be obtained by addressn t the company or any of its offices. Correspondenc invited.

Do you lack steam? We can help you.
THE FAMOUS "TOWER" LINE OF EDGERS
Why pay **twice as much** for an edger requiring **twice the power and floor space,** and doing no better work?
Note the following valuable features:
1. They take up little room.
2. They require little power.
3. The feed rolls are adjustable in FOUR directions, which means absolute accuracy.
4. The saws may be removed easily and quickly, without disturbing the arbor.
5. The mechanism for shifting the saws is up-to-date, convenient and positive.
6. The vital parts are carried by a substantial iron husk resting solidly on the floor.
7. There is no edger made approaching them in cheapness.
Made in two sizes, as follows:
The **TOWER 2 and 3-saw Edgers,** Improved. For mills cutting up to 20,000 ft. in ten hours.
The **TOWER EXTRA 3-saw Edgers.** For mills cutting up to 30,000 ft. in ten hours.
We also manufacture
The Celebrated and Only Original
GORDON HOLLOW BLAST GRATE
and
The "TOWER" One-Man 2-saw Trimmer.
The only **one-man** trimmer on the market. For mills cutting up to 30,000 ft. in ten hours. **Two feeds.**

MADE IN CANADA
FAIRBANKS WOOD-SPLIT PULLEY
The Best for Saw and Planing Mills
This pulley is not an experiment but has been sold for several years past all over the United States, and the universal satisfaction it gave and the success it met with prompted us to manufacture in Canada.
It has a reputation superior to that of any other Pulley for merit of design, workmanship and finish.
The web construction (see cut), built in the rim, not only strengthens the entire Pulley but makes it impossible for the rim to work loose at the arm.
Each segment is not only glued but nailed with three nails to the next one. Four point bushings are used, giving twice as much grip on the shaft as in the usual two piece bushing.
The merits of any article are best proved by a trial. Send us a trial order the next time you want any pulleys. We carry a large stock and with our factory in Montreal can supply any special pulley in 24 hours if not in stock.

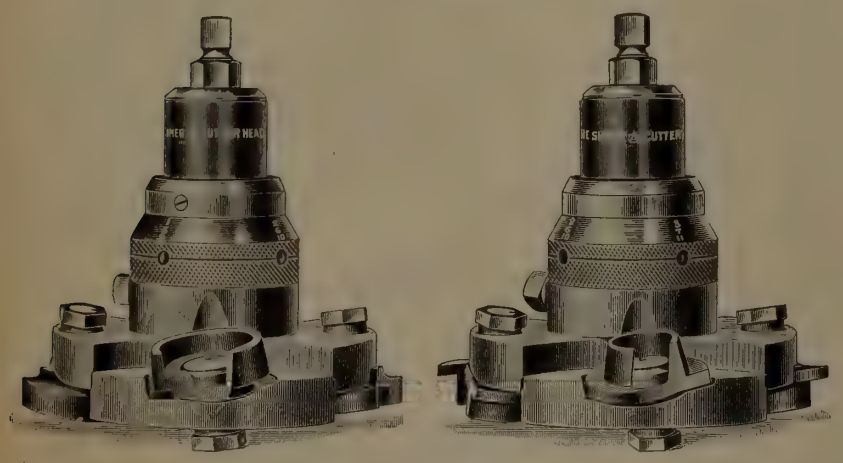
The Shimer Cutter Heads

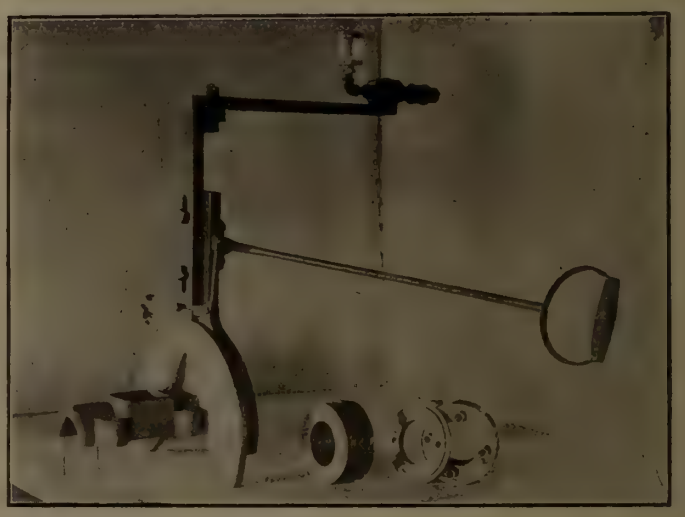
WITH EXPANSION



Are built from forgings of Steel and finished throughout in the solid metal. This insures accuracy, durability and perfect mechanical adjustments.

They are appreciated by the user because they hold up under the severest tests. They cut easily all kinds of hard, knotty and cross-grained lumber. If you make single tongue and groove Flooring, Ceiling and Wainscoting, buy THE SHIMER CUTTER HEADS and you will have no disappointment. Address

SAMUEL J. SHIMER & SONS
Milton, Pennsylvania



"KILLAM'S TANDEM CIRCULAR SAW MILL"

The attention of Manufacturers of Lumber is called to the above named latest and best method of sawing lumber.

The following advantages are obtained :

Lower cost of installation than any other method which will saw an equal number of superficial feet in a given length of time.

Smaller expense in operation, thus producing lumber at a lower cost per thousand feet than any other method.

Requires no more help to operate it than any well equipped Circular Saw Mill.

Lumber has been sawn better and more accurately cut by this method than by any other now in use.

The Killam Tandem Circular Mill requires no more skilled men to operate it than is required to operate the ordinary Circular Mill.

If solid saws are used, the larger one, when worn down can be used for the smaller one thus saving expense for saws.

No difficulties in handling or setting by this machine and no delays.

No time is lost in setting for any thickness from the cut of stationary saw up to six inches.

This machine takes the place of a resaw in a mill and only requires a floor space of 6 ft. x 6 ft.

Also takes the place of a Twin Circular Mill that is now used for slabbing, and this machine will side as much lumber as any Twin Circular, thus saving the expense of a resaw and men to operate the same.

This machine is so cheap that any manufari turer of lumber can well afford to have one,foth will ppy for itself in a short time.

Will cut 50 per cent. more lumber an thet Ctrcular Mills now in use.

MANUFACTURED BY OXFORD FOUNDRY & MACHINE COMPANY, OXFORD, N. S.

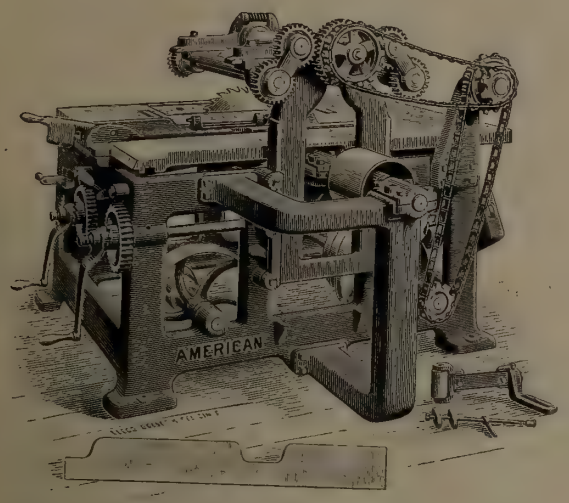
REFERENCE.

M. L. KILLAM, TRURO, N. S.

Dear Sir,—It gives us great pleasure to testify to the value of your Tandem Circular Saw Mill It has paid for itself twice over during the six months we have run it. It requires no more help to operate it and the lumber is more evenly sawn. It does all that you claim it will and we would recommend it to any manufacturer who wishes to make more and better lumber with the same help as with the Single Circular Mill. Wishing you success, we are Yours very truly,

Dec. 31, 1903. DICKIE & McGRATH Tusket, N. S

American No. 2 Self-Feed Rip Saw Table



Opposite Side--May be Belted in Any Direction.

Designed for ripping hard or soft woods up to 25 inches in width and 6 inches thick.

The Arbor is extended so as to carry two or more saws. Extreme distance between saws 6½ inches. By placing the saw against outside collar 31 inches in width can be ripped.

Table, 40 inches wide, by 55½ inches long, provided with two idler rolls and throat plate.

Feed, strong and positive; is adjustable so as to lay close to a 10 inch saw and expands to take in a 20 inch saw.

Our improved self-locking gauge is simple in construction, easy to operate and when set is perfectly rigid.

Workmanship the very best throughout.

Write for full particulars.

Reliable Veterinary Remedies

No logging outfit is complete without a supply of reliable veterinary remedies. Getting the wrong kind means the loss of the use of your horses when time is valuable.

Johnson's Veterinary Remedies

are guaranteed never to fail when used as directed. You get your money back if they ever do.

They are

Johnson's Horse Linimint No. 1.
A penetrating Alcoholic Linimint. Put up in one gallon jugs, with full directions, per imperial gal. $4.50

Johnson's Horse Linimint No. 2.
A combination of the best oils used as linimints, imp. gallon . . $3.00

Johnson's Horse Colic Remedy.
A sure and speedy cure for colic Imperial gallon $5.00

Johnson's Veterinary Healing Ointment.
Positively the best all-round healing ointment made. In use by the largest owners of horse flesh in Canada. Put up in 2 lb tins, each . . $2.00
or in ¼ lb tins, per dozen . . $3.00

Johnson's Condition Powders. (Concentrated).
Put up in bulk, per lb . . . . 3c.

These goods being put up in bulk are more economical than others, as cost of bottling, etc., is saved.

CAMP REMEDIES.

In addition to our Veterinary Remedies we make a line of medicines for lumbermen, including a strong, penetrating linimint, healing ointment, cholera cure, liver pills, cough syrup, in fact anything in the form of Camp Drug Supplies. We know that there are no better remedies made than those we offer. There may be others nearly as good, but they lack our guarantee. Satisfaction or money back. A trade discount of 10% allowed off all orders amounting to $100.

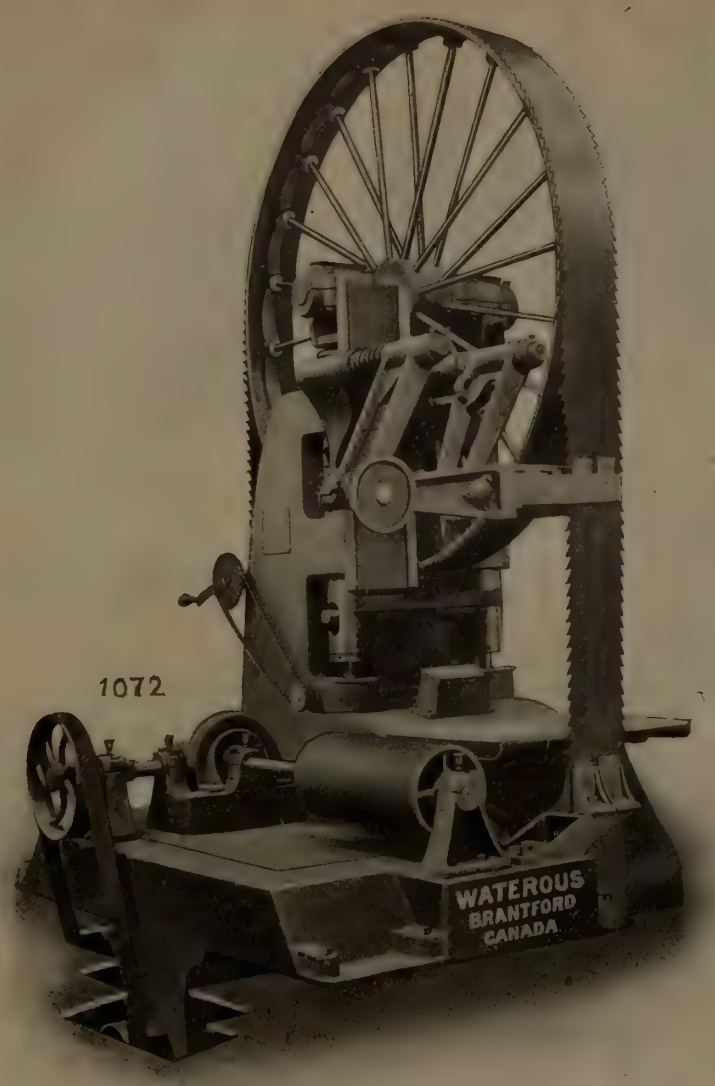
Greater Shingle Profits

Can be made by using this machine than by any other shingle machine on the market. Easy enough said, but easier proved.

The Columbia Shingle Machine

Is not only the fastest, strongest, safest and easiest operated, but it is the ONLY machine made having point regulation, enabling you to make 1,000 additional shingles from every 1,000 feet of logs. That's why your shingle profits wil be greater if you use it. Let us explain it in detail. Write.

Perkins & Co. GRAND RAPIDS MICHIGAN



17 to 30% SAVED

By Cutting Small Logs with

DOUBLE CUTTING BAND MILL

Instead of with CIRCULAR

This Illustration shows our DOUBLE CUTTING PONY BAND MILL, 6 foot Wheels, Suitable for Portable or Stationary Mills of which

MESSRS. BUCKNAM BROS. COMPANY, Whitney, Ont., write as follows :

"Re Pony Band. We started it last week, and we take great pleasure in saying that the machine works in every way first class and satisfactorily. We are running it 10,285 feet per M. We are running 15 gauge saws and they work very good, space of teeth 1½ inches apart.

As to the capacity of the machine, we think it will be from 25 to 30 M. per day. It is hard to say just at present, as you know it takes a few days to get all of the men into what you want before you can get good results, but we can say that the machine is cutting 20 M. per day now out of small logs—spruce and balsam, and some ash.

It is the slickest rig we ever saw. It will cut as fast as any circular saw we ever saw, and we have been in the saw mill business for 27 years, and we have had some fast rigs.

We would be pleased to have any person that is interested, or wanting a Pony for cutting logs from 24 in. down, to call and see it work, as it will stand inspection."

We Manufacture a Special Complete Line of
